

**Foundation Design of a Shopping complex  
at Pratap Vihar, Ghaziabad, Uttar Pradesh**

**By**

**SHIRAGRA SINGH - 111654**

**Under the guidance of**

**Dr. S.K. Jain**

**(Former Associate Professor)**

**Submitted in partial fulfillment  
of  
the Degree of Bachelor of Technology  
to  
DEPARTMENT OF CIVIL ENGINEERING  
JAYPEEUNIVERSITY OF INFORMATION TECHNOLOGY  
WAKNAGHAT**

**May-2015**

## **CERTIFICATE**

This is to certify that the work entitled, “**Foundation Design of a Shopping complex at Pratap Vihar, Ghaziabad, Uttar Pradesh**” submitted by **SHIRAGRA SINGH** in partial fulfillment for the award of degree of Bachelor of Technology in Civil Engineering at Jaypee University of Information Technology has been carried out under my supervision. This work has not been submitted partially or wholly to any other University or Institute for the award of this or any other degree or diploma.

**(Dr. S.K. JAIN)**

Professor,

Department of Civil Engineering

Jaypee University Anoopshahr, Distt- Bulandshahr,

Former Associate Professor,

JUIT Solan, Wagnaghat - 173234

Certified the above mentioned project work has been carried out by the said group of students.

**(Dr. ASHOK K. GUPTA)**

Professor and Head

Department of Civil Engineering

Jaypee University of information Technology

Solan, Wagnaghat - 173234

## ACKNOWLEDGEMENT

The success of any project depends largely on the encouragement and guidelines of many others. Therefore we take this opportunity to express our sincere gratitude to the people who have been instrumental in the successful completion of the project.

We would like to express our sincere appreciation and gratitude to our guide **Dr. S.K. Jain** without whose able guidance, tremendous support and continuous motivation the project would not have been carried to perfection. We sincerely thank him for spending all his valuable time and energies during the execution of project.

We take this opportunity to express our sincere gratitude to the Professor and Head of Department of Civil Engineering, **Dr. Ashok Kumar Gupta** for all his support and valuable inputs. We thank him for reviving Civil Engineering as the overall mentor by leading with a vision and teaching us with a knowledge imparting attitude.

The successful compilation of final year project depends on the knowledge and attitude inculcated in the total length of course. So we want to express our sincere gratitude to all the faculties who taught us during the four years of B.Tech.

**Shiragra Singh (111654)**

## ABSTRACT

This Project work titled “**Foundation Design of a Shopping complex at Pratap Vihar, Ghaziabad, Uttar Pradesh.**” involves the study and analysis of the soil profile at Pratap vihar, Ghaziabad to calculate the bearing capacity of the soil at various depths with the help of the geotechnical data obtained from Plate load test, Standard Penetration test and direct cone penetration test which were performed on the soil by the geotechnical experts.

Further, this work involves the Design of foundation of a shopping complex on the same soil profile using R.C.C. analysis with the help of the bearing capacities calculated from different tests for various depths. All the design considerations and norms according to the Indian standard codes have been thoroughly followed. Main aim of this Project work is to provide ready to implement design techniques and requirements.

# SECTION 1: INTRODUCTION

## 1.1 General:

### Basic Definitions

**Bearing capacity:** It is the load carrying capacity of the soil.

**Ultimate bearing capacity or Gross bearing capacity ( $q_u$ ):** It is the least gross pressure which will cause shear failure of the supporting soil immediately below the footing.

**Net ultimate bearing capacity ( $q_{nu}$ ):** It is the net pressure that can be applied to the footing by external loads that will just initiate failure in the underlying soil. It is equal to ultimate bearing capacity minus the stress due to the weight of the footing and any soil or surcharge directly above it. Assuming the density of the footing (concrete) and soil ( $\gamma$ ) are close enough to be considered equal, then

$$q_{nu} = q_u - \gamma D_f.$$

Where,  $D_f$  = depth of the footing

**Safe bearing capacity:** It is the bearing capacity after applying the factor of safety (FOS). These are of two types:

- **Safe net bearing capacity ( $q_{ns}$ ):** It is the net soil pressure which can be safely applied to the soil considering only shear failure. It is given by,

$$q_{ns} = \frac{q_{nu}}{FOS}$$

- **Safe gross bearing capacity ( $q_s$ ):** It is the maximum gross pressure which the soil can carry safely without shear failure. It is given by,

$$q_s = q_{ns} + \gamma D_f.$$

**Allowable Bearing Pressure:** It is the maximum soil pressure without any shear failure or settlement failure.

**Fig.1 Bearing capacity of footing**

**Bearing capacity:**

Building codes of various organizations in different countries give the allowable bearing capacity that can be used for proportioning footings. These are “Presumptive bearing capacity values based on experience with other structures already built. As presumptive values are based only on visual classification of surface soils, they are not reliable. These values don't consider important factors affecting the bearing capacity such as the shape, width, depth of footing, location of water table, strength and compressibility of the soil. Generally these values are conservative and can be used for preliminary design or even for final design of small unimportant structure. IS1904-1978 recommends that the safe bearing capacity should be calculated on the basis of the soil test data. But, in absence of such data, the values of safe bearing capacity can be taken equal to the presumptive bearing capacity values given in Table 1 for different types of soils and rocks. It is further recommended that for non-cohesive soils, the values should be reduced by 50% if the water table is above or near base of footing.

## 1.2 Types of failures in soil

**General shear**  
Dense soils,  
Rock, NC clays  
Defined failure surf.  
Fast failure

### Local Shear

Immediate case  
Gradual failure

### Local shear

Intermediate case  
+/- gradual failure

**Fig 2:- Types of failures in soil**

## 1.3 Methods of analyzing the soil

The various methods of computing the bearing capacity can be listed as follows:

1. Analytical Methods
2. Plate Bearing Test
3. Penetration Test

### Analytical Methods:-

This method includes:

Terzaghi's Bearing Capacity Theory

Skempton's Analysis for Cohesive soils

Meyerhof's Bearing Capacity Theory

Hansen's Bearing Capacity Theory

Vesic's Bearing Capacity Theory

IS code method

### 1.4 Terzaghi's Bearing Capacity Theory

There are certain assumptions in Terzaghi's Bearing Capacity Theory,

- Depth of foundation is less than or equal to its width.
- Base of the footing is rough.
- Soil above bottom of foundation has no shear strength; is only a surcharge load against the overturning load
- Surcharge upto the base of footing is considered.
- Load applied is vertical and non-eccentric.
- The soil is homogenous and isotropic.
- L/B ratio is infinite.

Fig.3 Terzaghi's Bearing Capacity Theory

## Extensions of Terzaghi's Original Theory

### (a) Local Shear Failure

Terzaghi's theory can still be used but with the reduced values of  $c$  and  $\phi$ .  
Reduce  $c$  and  $\phi$  such that,

$$(c)_{new} = \frac{2}{3} c$$

$$\tan(\phi)_{new} = \left(\frac{2}{3}\right) \tan\phi$$

Then, Terzaghi's equation of bearing capacity becomes,

$$q_u = \left(\frac{2}{3}\right) c N_c + q N_q + 0.5 \gamma B N_\gamma$$

where  $N_c$ ,  $N_q$ , and  $N_\gamma$  are read from the tables of general shear failure using,

$$(\phi)_{new} = \tan^{-1}(0.667 \tan\phi)$$

Here,  $c$  and  $\phi$  are the shear strength parameters for the soil experiencing local shear failure.

### (b) Square and Circular Footings

(i) for square footing

$$q_u = 1.2 c N_c + q N_q + 0.4 \gamma B N_\gamma$$

(ii) for circular footing

$$q_u = 1.2 c N_c + q N_q + 0.3 \gamma B N_\gamma$$

For circular footings,  $B$  is taken as the diameter of the footing.

(c) **Effect of the Ground Water:** Rules are,

- 1) If the water table is below the rupture zone (depth  $B$  below base level), the water table has no effect on bearing capacity.
- 2) If the water table is in the rupture zone, then modify  $\gamma$  in Terzaghi's equation.
- 3) If the water table is above the base level of the footing, then modify  $\gamma$  and  $q$  both in Terzaghi's equation.

We modify  $\gamma$  in Terzaghi's equation as per 3 cases:

**Case 1:**  $D_w \geq D_f + B \rightarrow \gamma_{new} = \gamma$  (no change)

**Case 2:**  $D_f < D_w < D_f + B$

Interpolate between  $\gamma'$  at  $D_f$  and,  $\gamma$  at  $(D_f + B)$ . The Interpolation formula is,

$$\gamma_{new} = \gamma - \gamma_w \left(1 - \frac{D_w - D_f}{B}\right)$$

**Case 3:**  $D_w \leq D_f \rightarrow \gamma_{new} = \gamma' = \gamma - \gamma_w$

Note,  $\gamma'$  is the submerged or effective unit weight.

Different books, and I.S. codes, introduce the water table correction differently. But the end result is nearly the same. The following thumb rules are helpful in checking your computations.

- In granular soils, when the water table rises from below the rupture zone to the base of the footing, the bearing capacity goes down by 25%.
- In granular soils, when the water table rises from below the rupture zone to the ground surface, the bearing capacity goes down by 50%.

First thumb rule is often used in engineering practice. A designer computes the bearing capacity assuming that the water table is touching the base of the footing even though the observed position of water table is below the rupture zone.

## 1.5 Types of foundation

### Types of Foundations

Based on the position with respect to ground level, Footings are classified into two types;

1. Shallow Foundations
2. Deep Foundations

Shallow Foundations are provided when adequate SBC is available at relatively short depth below ground level. Here, the ratio of  $D_f / B < 1$ , where  $D_f$  is the depth of footing and  $B$  is the width of footing.

Deep Foundations are provided when adequate SBC is available at large depth below ground level. Here the ratio of  $D_f / B \geq 1$ .

## **Types of Shallow Foundations**

The different types of shallow foundations are as follows:

- Isolated Footing
- Combined footing
- Strap Footing
- Strip Footing
- Mat/Raft Foundation

### **Isolated Column Footing**

These are independent footings which are provided when

- SBC is generally high
- Columns are far apart
- Loads on footings are less

The isolated footings can have different cross section Some of the popular shapes of footings are;

- Square
- Rectangular
- Circular

The isolated footings essentially consists of stepped or sloping in nature. The bottom of the slab is reinforced with steel mesh to resist the two internal forces namely bending moment and shear force.

The sketch of a typical isolated footing is shown

**Fig 4- Plan and section of isolated footing**

## SECTION 2: VBA PROGRAM

### 2.1 Introduction

- The Windows version of Excel supports programming through Microsoft's [Visual Basic for Applications](#) (VBA), which is a dialect of [Visual Basic](#). Programming with VBA allows spreadsheet manipulation that is awkward or impossible with standard spreadsheet techniques. Programmers may write code directly using the Visual Basic Editor (VBE), which includes a window for writing code, debugging code, and code module organization environment. The user can implement numerical methods as well as automating tasks such as formatting or data organization in VBA and guide the calculation using any desired intermediate results reported back to the spreadsheet.
- A common and easy way to generate VBA code is by using the [Macro Recorder](#). The Macro Recorder records actions of the user and generates VBA code in the form of a macro. These actions can then be repeated automatically by running the macro. The macros can also be linked to different trigger types like keyboard shortcuts, a command button or a graphic. The actions in the macro can be executed from these trigger types or from the generic toolbar options. The VBA code of the macro can also be edited in the VBE. Certain features such as loop functions and screen prompts by their own properties, and some graphical display items, cannot be recorded, but must be entered into the VBA module directly by the programmer. Advanced users can employ user prompts to create an interactive program, or react to events such as sheets being loaded or changed.
- VBA code interacts with the spreadsheet through the Excel Object Model a vocabulary identifying spreadsheet objects, and a set of supplied functions or methods that enable reading and writing to the spreadsheet and interaction with its users (for example, through custom toolbars or command bars and message boxes). User-created VBA [subroutines](#) execute these actions and operate like macros generated using the macro recorder, but are more flexible and efficient.

The program is used to determine bearing capacity using various input data from user as per Terzaghi Analysis discussed earlier. Program is made on excel using VBA coding. Various inputs that has been taken from user are:- length, breadth, depth of footing, etc. All the parameters like depth of water table eccentricity etc. are considered. The program will give net ultimate, net safe, allowable bearing capacity plus allowable loading.

## 2.2 VBA Coding

The following code written in macros in excel, will calculate the results.

```
Sub BEARING()

**DESIGN**

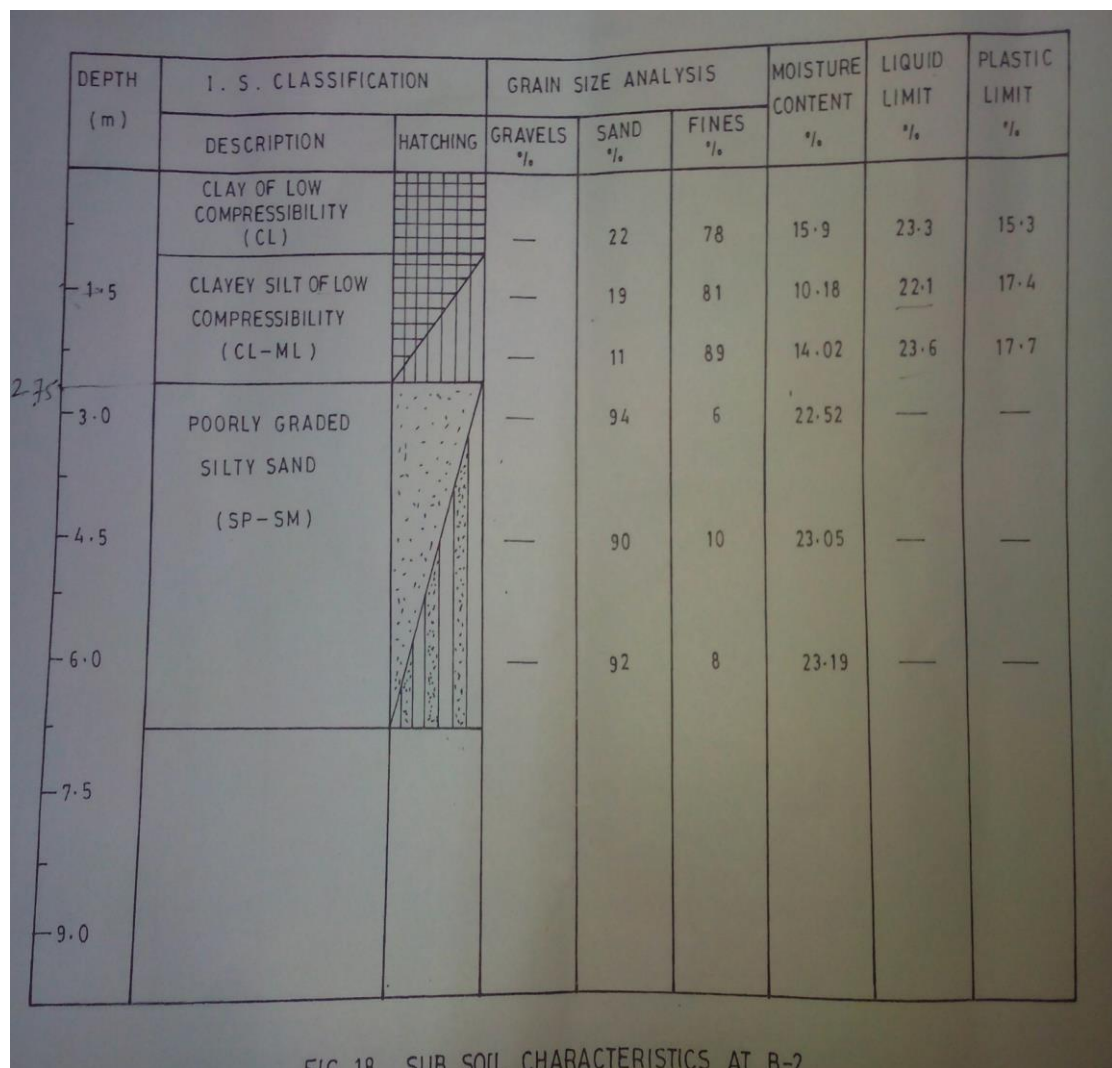

**Fig.5- Output in excel**

## SECTION 3: ANALYSIS OF SOIL

Estimating the bearing capacity of the soil from the field data given for PLT, SPT, DCPTn tests to calculate width of footing for required load of the building, considering both settlement and shear criteria. Also various parameters such as unconfined shear and compressive strength, cohesion, angle of internal resistance etc. can be also known by conducting test and properly analyzing them.

### 3.1 Location And Soil Profile:

The test data analyzed here is taken from Pratap Vihar in Ghaziabad. Soil profile of the site is shown below,

**Fig. 6- Soil profile**

### 3.2 Standard Penetration Test

- The **standard penetration test (SPT)** is an in-situ dynamic penetration test designed to provide information on the [geotechnical engineering](#) properties of [soil](#).
- The main purpose of the test is to provide an indication of the relative density of [granular](#) deposits, such as [sands](#) and [gravels](#) from which it is virtually impossible to obtain undisturbed samples. The great merit of the test, and the main reason for its widespread use is that it is simple and inexpensive.

Fig 7: Setup of SPT

The following is the test data obtained when SPT test is performed on the soil,

**Fig.8 Standard penetration resistance vs depth**

**Corrections for SPT VALUE**

- **Overburden pressure**

$$N' = C_N N_{spt}$$

$$C_N = 0.77 \log_{10} \frac{2000}{P'} \quad \text{where } P' = \gamma * D \quad \gamma = \text{unit wt of soil} \quad D = \text{depth}$$

- **Dilatancy correction**

$$N'' = 15 + 0.5(N' - 15) \quad \text{for } N' > 15$$

$$N'' = N' \quad \text{for } N' < 15$$

Bearing Capacity of soil at a depth of foundation 1.5 m.

Calculating SPT value for depth=1.5m using  $\gamma= 17\text{kN/m}^3$ , we get SPT value  $N= 18$

### Terzaghi's Analysis-

#### Shear criteria-

Net ultimate bearing capacity ,

$$q_{nu} = cN_c S_c + q(N_q - 1) + 0.5\gamma B N_\gamma S_\gamma$$

For undrained cohesive soil-

$$\phi_u = 0$$

$$N_\gamma = 0$$

$$N_q = 1$$

$$N_c = 5.14$$

For strip footing

$$S_c = S_\gamma = 1$$

From SPT data –

Corrected SPT value = 18 for depth = 1.5m

**TABLE 1: Correlation with N value for cohesive soil**

N VALUE	UNCONFINED COMPRESSIVE STRENGTH(kg/CM <sup>2</sup> )	CONSISTENCY
<2	<0.25	VERY SOFT
2-4	0.25 – 0.50	SOFT
4-8	0.50 – 1.0	MEDIUM
8-16	1.0 – 2.0	STIFF
16-32	2.0 – 4.0	VERY STIFF
>32	>4.0	HARD

$$C_u = 100 \text{ KN/m}^2$$

$$q_{nu} = 706 \text{ KN/m}^2$$

$$q_{ns} = 260 \text{ KN/m}^2$$

$$q_{ns} = 26 \text{ t/m}^2$$

### Settlement criteria-

The following shows the relation between settlement and width of footing.

Fig. 9 Settlement vs width of footing curve

$N=18, B=1.5\text{m}$

Permissible settlement = 50 mm

$q_{np} = 285.7 \text{ KN/m}^2$

$q_{np} = 28.57 \text{ t/m}^2$

$q_{nabp} = \min.(q_{ns}, q_{np})$

$q_{nabp} = 20.5 \text{ t/m}^2$

### 3.3 Dynamic Cone Penetration Test

The following is the test data obtained when performed DCPT test on the soil,

- In geotechnical and foundation engineering, in-situ penetration tests have been widely used for site investigation in support of analysis and design. **Dynamic cone penetration** test is one of them.
- Its procedure is quite similar to the SPT , however a cone is used to obtain the penetration depth instead of using the split spoon sampler.

Fig 10:- Setup for DCPT test

Fig. 11 Dynamic cone penetration resistance vs depth

Table 2: DCPT Test Data

$$N_{spt} = N_{dcpt} / 1.5 \quad \text{till depth} = 3\text{m}$$

DEPTH	N (SPT)	N (DCPT)	N (CON.,SPT)	N (CORR.)	N (DESIGN)
.5	12	5	3.3	4.96	5
1	15	10	6.6	9.5	10
1.5	18	30	20	22	22
2	13	17	11.3	15.56	16
2.5	11	12	8	11.6	12
3	14	14	9.3	13.46	14
3.5	15	22	14.6	18	18

<b>4</b>	<b>15</b>	<b>30</b>	<b>20</b>	<b>22</b>	<b>22</b>
<b>4.5</b>	<b>16</b>	<b>37</b>	<b>24.6</b>	<b>25.52</b>	<b>26</b>
<b>5</b>	<b>16</b>	<b>38</b>	<b>25.3</b>	<b>25.86</b>	<b>26</b>
<b>5.5</b>	<b>17</b>	<b>42</b>	<b>28</b>	<b>27.8</b>	<b>28</b>
<b>6</b>	<b>18</b>	<b>48</b>	<b>32</b>	<b>30.7</b>	<b>31</b>

**Shear criteria:**

From here,

$$N_{\text{corrected}} = 22 \quad \text{for depth}=1.5\text{m}$$

$$C_u = 100 \text{ KN/m}^2 \quad (\text{Table 4})$$

$$q_{\text{nu}} = cN_c S_c + q(N_q - 1) + 0.5\gamma B N_\gamma S_\gamma$$

For undrained cohesive soil-

$$\phi_u = 0$$

$$N_\gamma = 0$$

$$N_q = 1$$

$$N_c = 5.14$$

$$q_{\text{nu}} = 614 \text{ KN/m}^2$$

$$q_{\text{ns}} = 215 \text{ KN/m}^2$$

$$q_{\text{ns}} = 21.5 \text{ t/m}^2$$

**Settlement criteria**

$$N=22, B=1.5\text{m}$$

Permissible settlement = 50 mm

$$q_{\text{np}} = 333.3 \text{ KN/m}^2 .$$

$$q_{\text{np}} = 33.33 \text{ t/m}^2 .$$

$$q_{\text{nabp}} = \min.( q_{\text{ns}}, q_{\text{np}})$$

$$q_{\text{nabp}} = 21.5 \text{ t/m}^2$$

Now the following curve is plotted.

**Fig. 12 N values vs depth**

### **3.4 Plate Load Test.**

- **PLATE LOAD TEST** is used to find the bearing capacity and settlement of the soil and settlement .
- **DESCRIPTION::** A Test Plate(Square or circular in shape) are used in PLT test. The plate is placed at proposed level of the foundation and is subjected to incremental loading. Settlement at each increment of the loading is measured and a load settlement curve is plotted. Bearing capacities and settlement are determined from the load settlement curves.

The following is the test data obtained when performed DCPT test on the soil,

**Fig.13 Settlement curve**

Plotting graph between load and settlement and applying tangent method we get.

### Shear criteria

$$(q_{nu})_{\text{plate}} = 35 \text{ t/m}^2$$

For clays;

$$(q_{nu})_{\text{plate}} = (q_{nu})_{\text{footing}}$$

$$(q_{nu})_{\text{footing}} = 35 \text{ t/m}^2$$

$$q_{ns} = 14 \text{ t/m}^2$$

$$q_{nabp} = 14 \text{ t/m}^2$$

.

### **Settlement criteria**

$$q_{np} = 38 \text{ t/m}^2$$

$$S_f/S_p = B_f/B_p$$

$$S_p = (0.05 \times 0.3) / 1.5$$

$$= 0.1 \text{ m}$$

$$= 10 \text{ mm}$$

Corresponding to 10 mm penetration net allowable bearing pressure =  $25.3 \text{ N/mm}^2$ .

Minimum net allowable bearing pressure from SPT, DCPT and PLT test data from above is,

$$q_{nabp} = 14 \text{ t/m}^2.$$

## **SECTION 4: FOUNDATION DESIGN OF A STORAGE UNIT**

### **4.1 Assumptions:**

- Live load on structure = 4 KN/m<sup>2</sup>
- Dead Load on structure = 1.5 KN/m<sup>2</sup>
- Thickness of masonry wall = 230 mm
- Diameter of bar used = 8 mm
- Length of footing = 8 m
- Depth of footing = 1.5 m
- Height of superstructure = 5 m
- Width of superstructure = 3 m
- Provided a Strip footing
- Fe 415 grade HYSD Reinforcement
- M-25 grade Concrete

**Fig. 14 Isometric view of storage unit**

#### 4.2 Calculations:

$$\text{Span between centers of bearing} = 3000 + \frac{230}{2} + \frac{230}{2} = 3.23 \text{ m}$$

Assuming  $P_t = 0.3\%$ , Modification factor = 1.4 and slab is simply supported.

$$\frac{\text{Span}}{\text{Effective Depth}} = 20 \times \text{M. F.}$$

$$d_{\text{eff}} = \frac{230}{20 \times 1.4}$$

$$= 116.35 \text{ mm}$$

$$d_{\text{eff provided}} = 117 \text{ mm}$$

Provide 8mm diameter bars at a clear cover of 15mm.

$$\text{Effective cover} = 15 + 8/2 = 19 \text{ mm}$$

$$\text{Overall depth required} = 117 + 20 = 137 \text{ mm}$$

$$\text{Provided overall depth} = 140 \text{ mm}$$

$$\text{Now, } d_{\text{eff}} = 140 - 19 = 120 \text{ mm}$$

$$\text{Dead load due to slab} = 25 \times 0.140 = 3500 \text{ N/m}^2$$

$$\text{Dead load due to finish partition} = 1500 \text{ N/m}^2$$

$$\text{Total load} = \text{D.L.} + \text{L.L.}$$

$$= (3500 + 1500) + 4000$$

$$= 9000 \text{ N/m}^2$$

Design load = Factored load

$$= 1.5 \times 9000$$

$$= 13500 \text{ N/m}^2$$

Effective span = min (Distance between centers of bearing, clear span + effective depth)

$$= \min (3.23, 3+0.121)$$

$$= 3.121 \text{ m}$$

Consider 1m wide strip of slab,

$$\text{Factored moment } M_u = \frac{w_u \times l^2}{8}$$

$$= \frac{13300 \times 3.121^2}{8}$$

$$= 16337.33 \text{ N-m}$$

Moment of resistance  $M_{u, \text{limit}}$  for Fe 415

$$M_{u, \text{limit}} = 0.138 f_{ck} b d^2$$

$$M_u = M_{u, \text{limit}}$$

$$16337.33 \times 10^3 = 0.138 \times 25 \times 1000 \times d_{\text{eff}}^2$$

$$d_{\text{eff}} = 63 \text{ mm}$$

$d_{\text{eff}}$  provided = 121 mm (safe as  $d_{\text{eff}}$  provided >  $d_{\text{eff}}$ )

$$M_u / b d^2 = 1.1226$$

$$\text{Percentage of steel required, } P_t = 50 \times \left[ \frac{1 - \sqrt{1 - \frac{4.6 \times M_u}{f_{ck} b d^2}}}{f_y / f_{ck}} \right]$$

$$= 0.33\%$$

$$\frac{A_{st}}{b \times d_{\text{eff}}} \times 100 = 0.33\%$$

$$A_{st} = 400 \text{ mm}^2$$

$$\text{Spacing of 8 mm dia. bars} = \frac{1000 \times \frac{\pi}{4} \times 8^2}{400}$$

$$= 125.21 \text{ mm}$$

Spacing of bars = 125 mm c/c.

$$\text{Number of bars} = \frac{1000}{\text{spacing}} \approx 8$$

$$\text{Actual area of steel provided, } A_{st, \text{provided}} = \frac{\pi}{4} \times 8^2 \times 8 = 402.12 \text{ mm}^2$$

$$\begin{aligned}\text{Actual percentage of steel provided} &= \frac{402.12}{1000 \times 121} \times 100 \\ &= 0.332\%\end{aligned}$$

Modification factor corresponding to 0.332% steel (Fe 415) = 1.39 ( by interpolation )

$$\Rightarrow \frac{\text{span}}{d_{\text{eff}} \times M.F.} = 20$$

$$\Rightarrow d_{\text{eff}} = 111.83 \text{ mm}$$

$$d_{\text{eff}} \text{ provided} = 121 \text{ mm}$$

Hence the design is safe in serviceability conditions.

### 4.3 Check For Shear:

Nominal shear stress,  $\tau_v = \frac{V_u}{bd}$

$$V_u = \frac{1360 \times 3 \times 1}{2}$$

$$= 20280 \text{ N}$$

$$\tau_v = \frac{20280}{1000 \times 121} = 0.166 \text{ N/mm}^2$$

Percentage of steel available near support = 0.332/2

$$= 0.166\%$$

Design shearing strength of concrete corresponding to 0.16% of steel,  $\tau_c = 0.3 \text{ N/mm}^2$

For 140 mm thick slab  $K = 1.30$

$$\tau_c' = K \tau_c$$

$$= 1.30 \times 0.3$$

$$= 0.39 \text{ N/mm}^2$$

$$\tau_v < \tau_c'$$

So the design is safe against shear.

### 4.4 Distribution Steel:

$A_{st}$  of distribution bar  $\geq 0.12\%$  of gross area for Fe 415

$$A_{st} \text{ of distribution bar} = 0.0012 \times 1000 \times 140$$

$$= 168 \text{ mm}^2$$

$$\text{Spacing of 8mm dia. bars} = \frac{50 \times 1000}{168}$$

$$=297.6\text{mm}$$

Provide 8 mm dia. bars @ 290mm c/c spacing.

#### 4.5 Design of Main Bars:

$$\text{No. of bars} = 8000/125 \approx 64$$

$$\text{No. of equally spaced bars} = (64-1) = 63$$

$$\text{Total spacing between first and last bars} = 63 \times 125 = 7875 \text{ mm}$$

$$\text{Development length} = 40 \times \phi = 40 \times 8 \approx 320 \text{ mm}$$

$$\text{Length} = 3460 - (15 + 15) = 3430 \text{ mm}$$

$$\text{Volume of steel used in main reinforcement} = \text{Area} \times \text{Length}$$

$$V_{\text{st main bars}} = 11034567.71 \text{ mm}^3$$

$$\text{Weight} = \text{Volume} \times \gamma_{\text{steel}}$$

$$= 880.2 \text{ N}$$

#### 4.6 Load Calculations:

$$\text{Total load (Weight of slab)} = 9000 \times 8 \times 3.46 = 250368 \text{ N}$$

$$= 250368 \text{ N or } 250.36 \text{ KN}$$

##### Load distribution:-

$$\text{Weight of slab on one masonry wall} = 125.81 \text{ KN}$$

$$\text{Load per unit length of masonry wall} = 15.64 \text{ KN/m}$$

$$\text{Unit length volume of masonry wall} = 0.23 \times 5 \times 1 = 1.15 \text{ m}^3 \text{ per m length of the wall.}$$

$$\text{Unit weight of bricks} = 16 \text{ KN/m}^3$$

$$\text{Weight of bricks} = 16 \times 1.15 = 18.4 \text{ KN/m}$$

$$\text{Total load on foundation, } Q = 18.4 + 15.64 = 34.04 \text{ KN/m}$$

#### 4.7 Design of RCC Footing

Minimum net allowable bearing pressure from SPT, DCPT and PLT test data from above is,  $q_{\text{nabp}} = 14 \text{ t/m}^2$

Width of the foundation-

$$q_{\text{nabp}} = Q/A$$

$$Q = 34 \text{ KN/m}$$

$$\text{Area} = B \times 1 \text{ m}^2$$

$$B \text{ (Calculated)} = 0.25 \text{ m}$$

Provided width  $B = 1 \text{ m}$

$$\text{Net upward soil pressure} = \frac{34}{0.25 \times 1} = 134 \text{ KN/m}^2$$

$$\text{Factored upward soil pressure per meter length, } P_o = 1.5 \times 134 \times 1 = 201 \text{ KN/m}$$

The critical section for moment is at the face of the wall.

$$\begin{aligned} M_{u, \text{lim}} &= \frac{P_o}{8} \times (B-b)^2 \\ &= \frac{51}{8} \times (1 - 0.23)^2 \\ &= 11.8 \text{ KN-m} \end{aligned}$$

$$M_{u, \text{lim}} = M_u$$

$$\begin{aligned} 11.8 \times 10^6 &= 0.138 f_{ck} b d^2 \\ &= 0.138 \times 25 \times 1000 \times d^{2+} \end{aligned}$$

$$d = 55 \text{ mm}$$

$$\text{Provided depth} = 1.4 \times 55 = 77 \text{ mm}$$

But according to IS 456, minimum footing depth should be 150 mm.

Actual depth provided,  $D = 150 \text{ mm}$

Take clear cover of 50mm and dia. of bar 8mm.

$$d_{\text{eff}} = 150 - 50 - 4 = 96 \text{ mm}$$

$$M_u / b d^2 = \frac{3.8167 \times 10^6}{1000 \times 96^2} = 0.4319$$

$$\begin{aligned} \text{Percentage of steel required, } P_t &= 50 \times \left[ \frac{1 - \sqrt{1 - \frac{4.6 \times M_u}{f_{ck} b d^2}}}{f_y / f_{ck}} \right] \\ &= 0.12\% \end{aligned}$$

$$A_{st} = 0.0012 \times 1000 \times 150 = 180 \text{ mm}^2$$

No. of bars provided of 8mm dia. = 4

Spacing = 288 mm c/c. (spacing should be less than 2 times depth = 300mm => safe)

### 4.8 Consolidation Settlement in Clay-

$$\Delta H = \frac{c_c}{1+e_0} H \log_{10} \frac{\sigma_v + \Delta\sigma_v}{\sigma_v}$$

$C_c$  = Compression index = .009( $w_L$ -10)

$\sigma_v$  = Effective initial overburden pressure .

$\Delta\sigma_v$  = Vertical stress increment due to footing load.

H = Thickness of clay layer (m)

Assuming Load dispersion at 30° from the vertical.

**Fig.15: Pressure distribution through soil**

**Table 3: Settlement calculation**

LAYER	DEPTH OF LAYER	THICKNESS OF THE LAYER(m)	$\sigma_v$ KN/m <sup>2</sup>	$\Delta\sigma_v$ KN/m <sup>2</sup>	$C_c$	$e_0$	SETTLEMENT $\Delta H$ (mm)
1	1.5	0.75	32.25	24.02	0.122	0.6	10.70
2	2.75	0.5	44	15.31	0.126	0.645	6.52

TOTAL SETTLEMENT=18mm

Consolidation Settlement in clay layer = 18 mm which is less than allowable settlement in clays that is 50 mm. Hence the design is safe.

**Fig. 16 Cross-section of the foundation**

## **SECTION 5: FOUNDATION DESIGN OF A SHOPPING COMPLEX (Isolated foundation)**

### **5.1 Specifications for Design as per IS 456 : 2000**

The important guidelines given in IS 456 : 2000 for the design of isolated footings are as follows:

#### **General**

Footings shall be designed to sustain the applied loads, moments and forces and the induced reactions and to ensure that any settlement which may occur shall be as nearly uniform as possible, and the safe bearing capacity of the soil is not exceeded (see IS 1904).

In sloped or stepped footings the effective cross-section in compression shall be limited by the area above the neutral plane, and the angle of slope or depth and location of steps shall be such that the design requirements are satisfied at every section.

Sloped and stepped footings that are designed as a unit shall be constructed to assure action as a unit.

#### **Moments and Forces**

In the case of footings on piles, computation for moments and shears may be based on the assumption that the reaction from any pile is concentrated at the centre of the pile.

For the purpose of computing stresses in footings which support a round or octagonal concrete column or pedestal, the face of the column or pedestal shall be taken as the side of a square inscribed within the perimeter of the round or octagonal column or pedestal.

### **Bending Moment**

The bending moment at any section shall be determined by passing through the section a vertical plane which extends completely across the footing, and computing the moment of the forces acting over the entire area of the footing on one side of the said plane.

### **Tensile Reinforcement**

The total tensile reinforcement at any section shall provide a moment of resistance at least equal to the bending moment on the section.

Total tensile reinforcement shall be distributed across the corresponding resisting section as given below:

- a) In one-way reinforced footing, the-reinforcement extending in each direction shall be distributed uniformly across the full width of the footing.
- b) In two-way reinforced square footing, the reinforcement extending in each direction shall be distributed uniformly across the full width of the footing.

## 5.2 Provided data

- Site location is Pratap vihar in Ghaziabad, Uttar Pradesh.
- Soil properties are determined from Tests performed earlier on the same soil profile
- Isolated foundation has been designed for each column
- R.C.C Design is done for each column according to Indian standard codes.
- Two storeyed shopping complex(8 shops)
- Floor area 4m X 8.5m of each shop.
- Height of each shop is 3m.
- Live load is 4KPa.
- Dead load due to finish, partition etc is 1.5 KPa.
- Fe 415 grade HYSD reinforcement and M25 grade concrete.
- Thickness of slab is 150mm.
- Column size is 300mm x 300mm..
- Beam size is 230mm x 250mm.

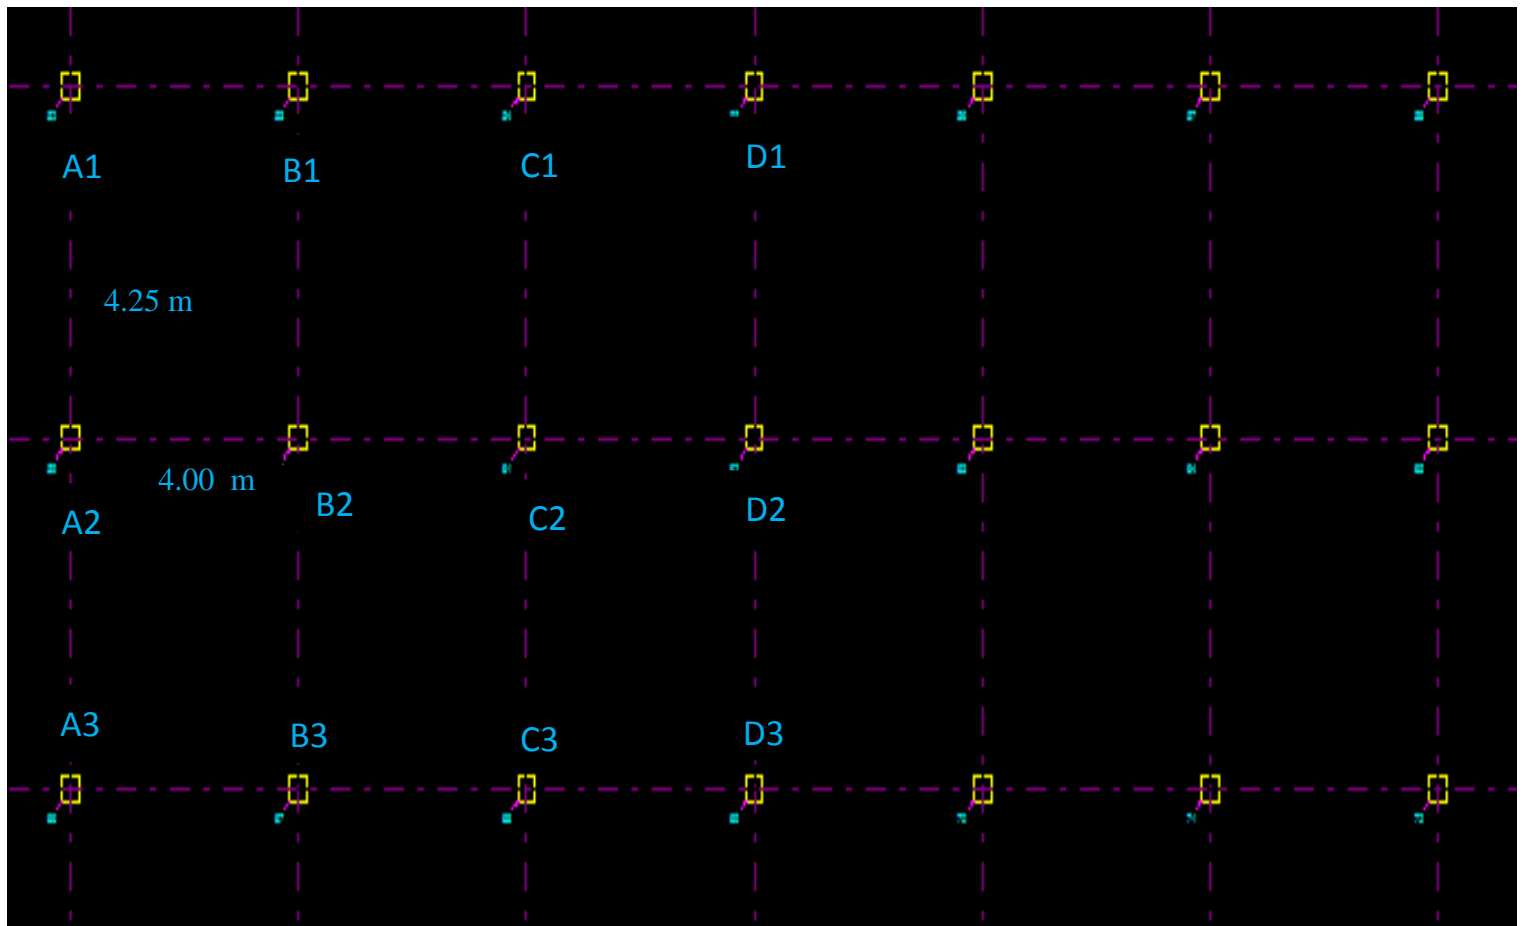

Fig 17:- Proposed structure

**Fig 18:- Front view of shopping complex**

**Fig 19:- Side view of shopping complex**

**Fig20 – Top view of Foundations**

### 5.3 Foundation Load Calculation

#### Axial loads on Foundation A1-

$$\begin{aligned} \text{Dead weight of slab} &= (4.25/2 \times 2 \times .15) \times \text{Unit wt of concrete} \\ &= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} \\ &= 15.9 \text{ kN} \end{aligned}$$

$$\begin{aligned} \text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25/2 + 2) \times 25 \\ &= 5.92 \text{ kN} \end{aligned}$$

$$\begin{aligned} \text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \\ &= 7.2 \text{ kN} \end{aligned}$$

$$\begin{aligned} \text{Dead load due to finish partition} &= 4.25/2 \times 2 \times 1.5 \\ &= 6.375 \text{ kN} \end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25/2 \times 2 \times 4 \\ &= 17 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 15.9 + 5.92 + 7.2 + 6.37 + 17 \\ &= 67 \text{ kN}\end{aligned}$$

### **Axial loads on Foundation A2-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25/2 \times 2 \times .15) \times 2 \times \text{Unit wt of concrete} \\ &= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} \\ &= 31.9 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 2) \times 25 \\ &= 8.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \\ &= 7.2 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 2 \times 1.5 \\ &= 12.75 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 2 \times 4 \\ &= 34 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 31.9 + 8.92 + 7.2 + 12.77 + 34 \\ &= 130 \text{ kN}\end{aligned}$$

### **Axial loads on Foundation A3-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25/2 \times 2 \times .15) \times \text{Unit wt of concrete} \\ &= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} \\ &= 15.9 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25/2 + 2) \times 25 \\ &= 5.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \\ &= 7.2 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25/2 \times 2 \times 1.5 \\ &= 6.375 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25/2 \times 2 \times 4 \\ &= 17 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 15.9 + 5.92 + 7.2 + 6.37 + 17 \\ &= 67 \text{ kN}\end{aligned}$$

#### **Axial loads on Foundation B1-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25/2 \times 2 \times .15) \times 2 \times \text{Unit wt of concrete} \\ &= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} \\ &= 31.9 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 2) \times 25 \\ &= 8.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \\ &= 7.2 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 2 \times 1.5 \\ &= 12.75 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 2 \times 4 \\ &= 34 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 31.9 + 8.92 + 7.2 + 12.77 + 34 \\ &= 131.7 \text{ kN}\end{aligned}$$

#### **Axial loads on Foundation B2-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25 \times 4 \times .15) \times \text{Unit wt of concrete} \\ &= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} \\ &= 63.9 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 4) \times 25 \\ &= 11.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \\ &= 7.2 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 4 \times 1.5 \\ &= 25.5 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 4 \times 4 \\ &= 68 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 63.9 + 11.92 + 7.2 + 25.5 + 68 \\ &= 240 \text{ kN}\end{aligned}$$

### **Axial loads on Foundation B3-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25/2 \times 2 \times .15) \times 2 \times \text{Unit wt of concrete} \\ &= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} \\ &= 31.9 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 2) \times 25 \\ &= 8.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \\ &= 7.2 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 2 \times 1.5 \\ &= 12.75 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 2 \times 4 \\ &= 34 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 31.9 + 8.92 + 7.2 + 12.77 + 34 \\ &= 131.7 \text{ kN}\end{aligned}$$

### **Axial loads on Foundation C1-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25 \times 2 \times .15) \times \text{Unit wt of concrete} + (4.25/2 \times 2 \times 0.15) \\ &\quad \times \text{Unit wt of concrete} \\ &= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} + (4.25/2 \times 2 \times 0.15) \times 25 \\ &= 47.9 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 2) \times 25 + 0.23 \times 0.25 \times (4.25/2 \\ &\quad + 2) \times 25 \\ &= 15.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \times 2 \\ &= 14.4 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 2 \times 1.5 + 4.25/2 \times 2 \times 1.5 \\ &= 19.75 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 2 \times 4 + 4.25/2 \times 2 \times 1.5 \\ &= 51 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead} \\ &\quad \text{Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 47.9 + 15.92 + 14.4 + 19.75 + 51 \\ &= 185 \text{ kN}\end{aligned}$$

#### **Axial loads on Foundation C2-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25 \times 2 \times .15) \times 25 \text{ kN} + (4.25 \times 4 \times 0.15) \times 25 \\ &= 95 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 2) \times 25 + 0.23 \times 0.25 \times (4.25 + \\ &\quad 4) \\ &= 19.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \times 2 \\ &= 14.4 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 2 \times 1.5 + 4.25 \times 4 \times 1.5 \\ &= 38.75 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 2 \times 4 + 4.25 \times 4 \times 1.5 \\ &= 102 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead} \\ &\quad \text{Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 95 + 19.92 + 14.4 + 38.75 + 102 \\ &= 335 \text{ kN}\end{aligned}$$

### **Axial loads on Foundation C3-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25 \times 2 \times .15) \times \text{Unit wt of concrete} + (4.25/2 \times 2 \times 0.15) \\ &\quad \times \text{Unit wt of concrete} \\ &= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} + (4.25/2 \times 2 \times 0.15) \times 25 \\ &= 47.9 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 2) \times 25 + 0.23 \times 0.25 \times (4.25/2 \\ &\quad + 2) \times 25 \\ &= 15.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \times 2 \\ &= 14.4 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 2 \times 1.5 + 4.25/2 \times 2 \times 1.5 \\ &= 19.75 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 2 \times 4 + 4.25/2 \times 2 \times 1.5 \\ &= 51 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead} \\ &\quad \text{Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 47.9 + 15.92 + 14.4 + 19.75 + 51 \\ &= 185 \text{ kN}\end{aligned}$$

### **Axial loads on Foundation D1-**

$$\begin{aligned}\text{Dead weight of slab} &= (4.25 \times 2 \times .15) \times \text{Unit wt of concrete} + (4.25 \times 2 \times 0.15) \\ &\quad \times \text{Unit wt of concrete} \\ &= (4.25 \times 2 \times .15) \times 25 \text{ kN} + (4.25 \times 2 \times 0.15) \times 25 \\ &= 127.5 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 4) \times 25 + 0.23 \times 0.25 \times (4.25 + \\ &\quad 4) \times 25 \\ &= 23.92 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \times 2 \\ &= 14.4 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 4 \times 1.5 + 4.25 \times 4 \times 1.5 \\ &= 51 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 4 \times 4 + 4.25 \times 4 \times 1.5 \\ &= 136 \text{ kN}\end{aligned}$$

$$\begin{aligned}
\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\
&= 2 \times 127.5 + 23.92 + 14.4 + 51 + 136 \\
&= 412 \text{ kN}
\end{aligned}$$

### **Axial loads on Foundation C3-**

$$\begin{aligned}
\text{Dead weight of slab} &= (4.25 \times 2 \times .15) \times \text{Unit wt of concrete} + (4.25/2 \times 2 \times 0.15) \\
&\quad \times \text{Unit wt of concrete} \\
&= (4.25/2 \times 2 \times .15) \times 25 \text{ kN} + (4.25/2 \times 2 \times 0.15) \times 25 \\
&= 47.9 \text{ kN}
\end{aligned}$$

$$\begin{aligned}
\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25 + 2) \times 25 + 0.23 \times 0.25 \times (4.25/2 \\
&\quad + 2) \times 25 \\
&= 15.92 \text{ kN}
\end{aligned}$$

$$\begin{aligned}
\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \times 2 \\
&= 14.4 \text{ kN}
\end{aligned}$$

$$\begin{aligned}
\text{Dead load due to finish partition} &= 4.25 \times 2 \times 1.5 + 4.25/2 \times 2 \times 1.5 \\
&= 19.75 \text{ kN}
\end{aligned}$$

$$\begin{aligned}
\text{Live load experienced} &= 4.25 \times 2 \times 4 + 4.25/2 \times 2 \times 1.5 \\
&= 51 \text{ kN}
\end{aligned}$$

$$\begin{aligned}
\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\
&= 2 \times 47.9 + 15.92 + 14.4 + 19.75 + 51 \\
&= 185 \text{ kN}
\end{aligned}$$

### **Axial loads on Foundation D3-**

$$\begin{aligned}
\text{Dead weight of slab} &= (4.25 \times 4 \times .15) \times \text{Unit wt of concrete} + (4.25 \times 4 \times 0.15) \\
&\quad \times \text{Unit wt of concrete} \\
&= (4.25 \times 4 \times .15) \times 25 \text{ kN} + (4.25 \times 4 \times 0.15) \times 25 \\
&= 63.67 \text{ kN}
\end{aligned}$$

$$\begin{aligned}
\text{Dead weight of Beam} &= 0.23 \times 0.25 \times (4.25/2 + 4) \times 25 + 0.23 \times 0.25 \times (4.25/2 \\
&\quad + 4) \times 25 \\
&= 18.92 \text{ kN}
\end{aligned}$$

$$\begin{aligned}
\text{Dead weight of Column} &= 0.3 \times 0.35 \times 2.75 (\text{Height of column}) \times 25 (\text{unit weight of concrete}) \times 2 \\
&= 14.4 \text{ kN}
\end{aligned}$$

$$\begin{aligned}\text{Dead load due to finish partition} &= 4.25 \times 2 \times 1.5 + 4.25 \times 2 \times 1.5 \\ &= 25.375 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Live load experienced} &= 4.25 \times 2 \times 4 + 4.25 \times 2 \times 1.5 \\ &= 68 \text{ kN}\end{aligned}$$

$$\begin{aligned}\text{Total Load on A1} &= 2 \times \text{dead weight of slab} + \text{Dead weight of Beam} + \text{Dead Weight of column} + \text{Dead load due to finish} + \text{Live load} \\ &= 2 \times 63.67 + 18.92 + 14.4 + 25.375 + 68 \\ &= 230 \text{ kN}\end{aligned}$$

Because our structure is symmetric about the D columns, therefore loads on foundation will also be symmetric about D columns:-

$$\begin{aligned}\text{Load on E1} &= \text{Load on A1} = 67 \text{ kN} \\ \text{Load on E2} &= \text{Load on A2} = 130 \text{ kN} \\ \text{Load on E3} &= \text{Load on A3} = 67 \text{ kN} \\ \text{Load on E1} &= \text{Load on B1} = 132 \text{ kN} \\ \text{Load on F2} &= \text{Load on B3} = 240 \text{ kN} \\ \text{Load on F3} &= \text{Load on B3} = 132 \text{ kN} \\ \text{Load on G1} &= \text{Load on C1} = 185 \text{ kN} \\ \text{Load on G2} &= \text{Load on C2} = 335 \text{ kN} \\ \text{Load on G3} &= \text{Load on C3} = 185 \text{ kN}\end{aligned}$$

#### 5.4 Width Calculation of footings:

Taking depth of footing ( $D_f$ ) from ground level = 1.5m

Net Safe Bearing capacity ( $q_{ns}$ ) of soil at depth 1.5m = 140 kN/m<sup>2</sup> (From PLT test)

$$\begin{aligned}\text{Surcharge above the footing} &= \gamma \times D_f \\ &= 18 \text{ kN/m}^2 \times 1.5\text{m} \\ &= 27 \text{ kN/m}^2\end{aligned}$$

Assuming Square footing, Area of footing =  $B^2$  (Where is Width of footing)

$$Q_{ns} = \frac{\text{Load on foundation}}{\text{area of footing}} = \frac{\text{Load}}{B \times B}$$

$$B^2 = \frac{\text{Load}}{Q_{ns}}$$

But considering Soil Surcharge, we get empirical formula,

$$B = \sqrt{\frac{\text{Load}-2.83}{113}}$$

Calculating width of Foundations based on the loads calculated:-

**For Foundation A1 -**

$$\text{Load} = 67 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{67-2.83}{113}} = 0.75\text{m}$$

**For Foundation A2 -**

$$\text{Load} = 130 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{130-2.83}{113}} = 0.95\text{m}$$

**For Foundation A3 -**

$$\text{Load} = 67 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{67-2.83}{113}} = 0.75\text{m}$$

**For Foundation B1 -**

$$\text{Load} = 132 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{132-2.83}{113}} = 0.96\text{m}$$

**For Foundation B2 -**

$$\text{Load} = 240 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{240-2.83}{113}} = 1.3\text{m}$$

**For Foundation B3 -**

$$\text{Load} = 132 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{132-2.83}{113}} = 0.96\text{m}$$

**For Foundation C1 -**

$$\text{Load} = 185 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{185-2.83}{113}} = 1.18\text{m}$$

**For Foundation C2 -**

$$\text{Load} = 335 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{335-2.83}{113}} = 1.65\text{m} , \text{ providing } 1.7\text{m}$$

**For Foundation C3 -**

$$\text{Load} = 185 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{185-2.83}{113}} = 1.18\text{m}$$

**For Foundation D1 -**

$$\text{Load} = 230 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{230-2.83}{113}} = 1.3\text{m}$$

**For Foundation D2 -**

$$\text{Load} = 412 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{412-2.83}{113}} = 1.85\text{m} , \text{ providing } 2\text{m}$$

**For Foundation D3 -**

$$\text{Load} = 185 \text{ kN}$$

$$B = \sqrt{\frac{\text{Load}-2.83}{113}} = \sqrt{\frac{185-2.83}{113}} = 1.3\text{m}$$

But since we are considering the foundations as shallow foundations, and according to Terzaghi analysis which is valid only for shallow foundations, the width of the footing should be equal to or greater than Depth of the foundation. Therefore minimum width of foundation for our structure will be equal to 1.5m (Depth of foundation).

### 5.5 Consolidation Settlement -

$$\Delta H = \frac{c_c}{1+e_0} H \log_{10} \frac{\sigma_v + \Delta\sigma_v}{\sigma_v}$$

$$C_c = \text{Compression index} = 0.009(w_L - 10)$$

$$\sigma_v = \text{Effective initial overburden pressure} = \gamma \times (D_f + C.L_{\text{layer}})$$

$$\square \sigma_v = \text{Vertical stress increment due to footing load} = \frac{\text{Load}}{\text{Area of spread}}$$

$$\text{Area of spread} = B' \times B', \quad B' = \text{Width of footing at } C.L_{\text{layer}}$$

H = Thickness of clay layer (m)

Assuming Load dispersion at 30° from the vertical.

$$C_c = (\text{liquid limit} - 10) \times 0.009$$

$$E_0 = \frac{G \times \gamma_w}{\gamma} - 1, \quad G = \text{Specific gravity} = 2.65, \quad w = \text{water content}$$

$$\gamma_w = \text{Saturated unit wt} = 10 \text{ kN/m}^3$$

**Table 4 : Calculation of settlement**

Foundation	Layer	Depth of layer (m)	Layer thickness (m)	$\sigma_v$ KN/m <sup>2</sup>	$\Delta\sigma_v$ KN/m <sup>2</sup>	$C_c$	$e_0$	Settlement $\Delta H$ (mm)	Total Settlement (mm)

D1	1	2.0	0.50	31.5	62	0.122	0.6	16.0	35
	2	2.75	0.75	42.75	51	0.126	0.645	19.0	
D2	1	2.0	0.50	31.5	88	0.122	0.6	19.6	44.6
	2	2.75	0.75	42.75	50	0.126	0.645	24.77	
D3	1	2.0	0.50	31.5	62	0.122	0.6	16.0	35
	2	2.75	0.75	42.75	51	0.126	0.645	19.0	

Maximum settlement is coming out for foundation  $D_2 = 44.6\text{mm} < 65\text{mm}$  (permissible settlement for clays according to IS Code 1904(1986), Code of practice for design and construction of foundation on soils. Therefore our Foundations are safe in settlement.

## 5.6 Depth of footing

Depth of footing is calculated on basis of 3 criteria :-

1. One way shear method
2. Two way shear method
3. Bending moment

Depth is calculated using the above stated 3 criteria's and the maximum of the three depth obtained from each criteria is taken as depth of footing.

Minimum depth of footing according to IS 456:2000 is 150mm

### 5.6.1 One way shear method

The critical section for one way shear occurs at a distance 'd' from the face of the column. (As shown in fig.)

**Fig 21 – One way critical section**

Shear force  $V$  at the critical section at  $d$  distance away from the face of the column is

$$V = q \times L \times \{(L-a)/2 - d'\} , \quad \text{where } (q = \frac{\text{Factored Load } P}{L \times L}) , \text{ } a = \text{column width}$$

$$V = P/L^2 \times L \times \{(L-a)/2 - d'\} \quad P = 1.5 \times \text{Design load}$$

$$V = \frac{P}{2L} (L - a - 2d')$$

Now,

$$\tau_c \times L \times d' = V = \frac{P}{2L} (L - a - 2d')$$

Where  $\tau_c$  = maximum shear stress = 3.1 N/mm<sup>2</sup> (IS 456:2000)

**Table 5 : Maximum shear Stress**

<b>Table 20 Maximum Shear Stress, <math>\tau_{c \text{ max}}</math>, N/mm<sup>2</sup></b>						
<i>( Clauses 40.2.3, 40.2.3.1, 40.5.1 and 41.3.1 )</i>						
Concrete Grade	M 15	M 20	M 25	M 30	M 35	M 40 and above
$\tau_{c \text{ max}}$ , N/mm <sup>2</sup>	2.5	2.8	3.1	3.5	3.7	4.0

On simplifying the above equation we get,

$$d' = \frac{P(L-a)}{2(P + \tau_c \times L \times L)}$$

### 5.6.2 Two way shear method

The critical section for the two way shear or punching shear occurs at a distance of  $d/2$  from the face of the column (See Fig.), where  $a$  is the side of the column

**Fig 22 – Two way critical section**

punching area of footing =  $(a + d)^2$

Perimeter of the critical section =  $4(a + d)$

Considering equilibrium of forces,

$$\frac{P}{L^2} [L^2 - (a + d)^2] = 4\tau_v(a + d)d$$

Where  $\tau_v$  = Punching shear stress

$$= 0.25\sqrt{fck}$$

$$= 0.25 \times \sqrt{25} \text{ N/mm}^2$$

$$= 1.25 \text{ N/mm}^2$$

Value of d will be calculated from the above equation.

### 5.6.3 Bending moment method(Flexure method)

The critical section for flexure occurs at the face of the column (Fig.).

The projection of footing beyond the column face is treated as a cantilever slab subjected to factored upward pressure of soil.

**Fig23 – Bending Moment critical section**

Moment at face of column

$$M = \frac{P}{L \times L} \left[ \frac{L(L-a)^2}{8} \right]$$

$$d = \sqrt{\frac{M}{0.138 \times f_{ck} \times L}}$$

**Table 6: Calculation of Bending Moment**

FOUNDATION	FOOTING WIDTH(m)	MOMENT AT THE FACE (KN-m)
A1	1.5	12.06
A2	1.5	23.4
A3	1.5	12.06
B1	1.5	24.1
B2	1.5	43.2
B3	1.5	24.1
C1	1.5	33.3
C2	1.7	60.3
C3	1.5	33.3

<b>D1</b>	1.5	41.4
<b>D2</b>	2.0	73.8
<b>D3</b>	1.5	41.4

#### 5.6.4 Calculating depth using above three criteria,

##### For Foundation A1

$$\text{One way, } d = \frac{67 \times 1.5 (1500 - 300)}{2(67 \times 1.5 + 310 \times 1500 \times 1500)} = 72 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 67}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d)d$$

$$d = 52 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{12.06 \times 1000}{.138 \times 25 \times 1.5}} = 48 \text{ mm}$$

##### For Foundation A2

$$\text{One way, } d' = \frac{130 \times 1.5 (1500 - 300)}{2(130 \times 1.5 + 310 \times 1500 \times 1500)} = 143 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 130}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d)d$$

$$d = 85 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{23.06 \times 1000}{.138 \times 25 \times 1.5}} = 67 \text{ mm}$$

##### For Foundation A3

$$\text{One way, } d' = \frac{67 \times 1.5 (1500 - 300)}{2(67 \times 1.5 + 310 \times 1500 \times 1500)} = 72 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 67}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d)d$$

$$d = 52 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{12.06 \times 1000}{.138 \times 25 \times 1.5}} = 48 \text{ mm}$$

### For Foundation B1

$$\text{One way, } d' = \frac{132 \times 1.5 (1500 - 300)}{2(132 \times 1.5 + 310 \times 1500 \times 1500)} = 145 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 132}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d) d$$

$$d = 113 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{24.1 \times 1000}{.138 \times 25 \times 1.5}} = 68 \text{ mm}$$

### For Foundation B2

$$\text{One way, } d' = \frac{240 \times 1.5 (1500 - 300)}{2(240 \times 1.5 + 310 \times 1500 \times 1500)} = 190 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 240}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d) d$$

$$d = 158 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{43.2 \times 1000}{.138 \times 25 \times 1.5}} = 93 \text{ mm}$$

### For Foundation B3

$$\text{One way, } d' = \frac{132 \times 1.5 (1500 - 300)}{2(130 \times 1.5 + 310 \times 1500 \times 1500)} = 143 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 132}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d) d$$

$$d = 113 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{24.1 \times 1000}{.138 \times 25 \times 1.5}} = 68 \text{ mm}$$

### For Foundation C1

$$\text{One way, } d' = \frac{185 \times 1.5(1500 - 300)}{2(185 \times 1.5 + 310 \times 1500 \times 1500)} = 162 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 185}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25(.3 + d)d$$

$$d = 135 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{33.3 \times 1000}{.138 \times 25 \times 1.5}} = 82 \text{ mm}$$

### For Foundation C2

$$\text{One way, } d' = \frac{335 \times 1.5(1700 - 300)}{2(335 \times 1.5 + 310 \times 1700 \times 1700)} = 250 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 335}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25(.3 + d)d$$

$$d = 192 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{60.3 \times 1000}{.138 \times 25 \times 1.5}} = 103 \text{ mm}$$

### For Foundation C3

$$\text{One way, } d' = \frac{185 \times 1.5(1500 - 300)}{2(185 \times 1.5 + 310 \times 1500 \times 1500)} = 162 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 185}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25(.3 + d)d$$

$$d = 135 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{33.3 \times 1000}{.138 \times 25 \times 1.5}} = 82 \text{ mm}$$

### For Foundation D1

$$\text{One way, } d' = \frac{230 \times 1.5(1500 - 300)}{2(230 \times 1.5 + 310 \times 1500 \times 1500)} = 202 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 230}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d)d$$

$$d = 154 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{41.4 \times 1000}{.138 \times 25 \times 1.5}} = 84 \text{ mm}$$

### For Foundation D2

$$\text{One way, } d' = \frac{412 \times 1.5 (2000 - 300)}{2(412 \times 1.5 + 310 \times 2000 \times 2000)} = 293 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 412}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d)d$$

$$d = 236 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{73.8 \times 1000}{.138 \times 25 \times 1.5}} = 108 \text{ mm}$$

### For Foundation D3

$$\text{One way, } d' = \frac{230 \times 1.5 (1500 - 300)}{2(230 \times 1.5 + 310 \times 1500 \times 1500)} = 202 \text{ mm}$$

$$\text{Two way, } \frac{1.5 \times 230}{1.5 \times 1.5} [1.5^2 - (.3 + d)^2] = 4 \times 1.25 (.3 + d)d$$

$$d = 154 \text{ mm}$$

$$\text{Bending moment, } d = \sqrt{\frac{41.4 \times 1000}{.138 \times 25 \times 1.5}} = 84 \text{ mm}$$

Now we'll take the maximum value of depth obtained from all the criteria for all the foundations. Minimum depth = 150mm (IS 456:2000).

**Table 7: Effective depth**

Foundation	One way shear depth $d_1$ (mm)	Two way shear depth $d_2$ (mm)	Bending moment depth $d_3$ (mm)	Max( $d_1, d_2, d_3$ ) (mm)	Minimum depth (mm)	Total effective depth(d) (mm)
A1	72	52	48	72	150	150
A2	143	85	67	143	150	150
A3	72	52	48	72	150	150
B1	145	113	68	145	150	150
B2	190	158	93	190	150	190
B3	145	113	68	145	150	150
C1	162	135	82	162	150	162
C2	250	192	103	250	150	250
C3	162	135	82	162	150	162
D1	202	154	84	202	150	202
D2	293	236	108	293	150	293
D3	202	154	84	202	150	202

## 5.7 R.C.C Design of Footings

The distribution of the total tensile reinforcement, calculated in accordance with the moment at critical sections, as specified in part (c) of this section, shall be done as given below for one-way and two-way footing slabs separately.

(i) In one-way reinforced footing slabs like wall footings, the reinforcement shall be distributed uniformly across the full width of the footing i.e., perpendicular to the direction of wall. Nominal distribution reinforcement shall be provided as per cl. 34.5 of IS 456 along the length of the wall to take care of the secondary moment, differential settlement, shrinkage and temperature effects.

(ii) In two-way reinforced square footing slabs, the reinforcement extending in each direction shall be distributed uniformly across the full width/length of the footing.

### 5.7.1 Transfer of load at the base of column

All forces and moments acting at the base of the column must be transferred to the pedestal, if any, and then from the base of the pedestal to the footing, (or directly from

the base of the column to the footing if there is no pedestal) by compression in concrete and steel and tension in steel. Compression forces are transferred through direct bearing while tension forces are transferred through developed reinforcement. The permissible bearing stresses on full area of concrete shall be taken as given below from cl.34.4 of IS 456:

$$\sigma_{br} = 0.25f_{ck}, \text{ in working stress method,}$$

The stress of concrete is taken as  $0.45f_{ck}$  while designing the column. Since the area of footing is much larger, this bearing stress of concrete in column may be increased considering the dispersion of the concentrated load of column to footing. Accordingly, the permissible bearing stress of concrete in footing is given by (cl.34.4 of IS 456):

$$\sigma_{br} = 0.45f_{ck} \left( \frac{A_1}{A_2} \right)^{1/2} \quad \text{with a condition that } \left( \frac{A_1}{A_2} \right)^{1/2} \leq 2.0$$

**Fig. 11.28.15: Bearing area in sloped or stepped footing**

**Fig 24 Bearing Area in footing**

where  $A_1$  = maximum supporting area of footing for bearing which is geometrically similar to and concentric with the loaded area  $A_2$ , as shown in Fig.

$A_2$  = loaded area at the base of the column.

If the permissible bearing stress on concrete in column or in footing is exceeded, reinforcement shall be provided for developing the excess force (cl.34.4.1 of IS 456), either by extending the longitudinal bars of columns into the footing (cl.34.4.2 of IS 456) or by providing dowels as stipulated in cl.34.4.3 of IS 456

### 5.7.2 Steel Reinforcement required

Calculating required area of main steel using RCC analysis according to indian standards using IS-456:2000.

$$A_{st} = \frac{M}{.87 * f_y * z}, \text{ where}$$

M= limiting moment

$$= \frac{P}{L \times L} \left[ \frac{L(L-a)^2}{8} \right]$$

$$z = \text{lever arm} = d \left( 1 - 0.42 \frac{x}{d} \right)$$

$$\frac{x}{d} = 1.2 - \left[ 1.44 - \frac{6.6 * M}{f_{ck} * L * d^2} \right]^{1/2}$$

Steel required is calculated in table

**Table 8: Calculation of Reinforcement**

Foundation	Moment (kN-m)	Effective depth (mm)	$\frac{x}{d}$	Lever arm (mm)	$A_{st}$ (mm <sup>2</sup> )
A1	12.06	150	.037	147.6	226.2
A2	23.4	150	.074	145.4	4465.9
A3	12.06	150	.037	147.6	226.2
B1	24.1	150	.076	145.2	459.6
B2	43.2	190	.085	183.2	653.14
B3	24.1	150	.076	145.2	459.8
C1	33.3	162	.091	155.8	591.86

C2	60.3	250	.068	242.8	687.77
C3	33.3	162	.091	155.8	591.86
D1	41.4	202	.072	195.9	585.32
D2	73.8	293	.061	285.5	715.85
D3	41.4	202	.072	195.9	585.32

Now According to IS 456:2000, Minimum % of steel provided  $P_t = 0.12\%$  for temperature and shrinkage

Therefore for all the footings, Minimum Required steel is calculated in Table

**Table 9: Reinforcement Description**

Foundation	Calculated $A_{st}$ ( $mm^2$ )	Minimum $A_{st}$ ( $mm^2$ )	Actual $A_{st}$ ( $mm^2$ )	Description	Provided $A_{st}$ ( $mm^2$ )
A1	326.2	270	330	7 bars- 8mm $\phi$	350
A2	465.9	270	470	6 bars- 10mm $\phi$	472
A3	326.2	270	330	7 bars- 8mm $\phi$	350
B1	459.6	270	460	6 bars- 10mm $\phi$	472
B2	653.14	342	655	6 bars- 12mm $\phi$	680
B3	459.8	270	460	6 bars- 10mm $\phi$	472
C1	591.86	292	595	6 bars- 12mm $\phi$	680
C2	687.77	510	690	7 bars- 12mm $\phi$	750
C3	591.86	292	600	6 bars- 12mm $\phi$	680
D1	585.32	370	590	6 bars 12mm $\phi$	680
D2	715.85	702	720	4 bars 16mm $\phi$	800
D3	585.32	370	590	6 bars 12mm $\phi$	680

## 5.8 Check for bearing stress

According to the Clause 34.4 of IS 456:2000, the permissible stress at the base of the column is

**The compressive stress in concrete at the base of a column or pedestal shall be considered as being transferred by bearing to the top of the supporting pedestal or footing. The bearing pressure on the loaded area shall not exceed the permissible bearing stress in direct compression multiplied by a value equal to**

$$\sqrt{\frac{A_1}{A_2}} \text{ but not greater than 2;}$$

where

$A_1$  = supporting area for bearing of footing, which in sloped or stepped footing may be taken as the area of the lower base of the largest frustum of a pyramid or cone contained wholly within the footing and having for its upper base, the area actually loaded and having side slope of one vertical to two horizontal; and

$A_2$  = loaded area at the column base.

Fig 25 – Permissible bearing stress

$$\text{Permissible bearing stress } \sigma_{br} = 0.45 \times f_{ck} \times \sqrt{(A_1/A_2)}$$

Such that  $\sqrt{(A_1/A_2)} \leq 2.0$  always.

For Minimum Footing dimension 1500mm × 1500mm and Column Dimension = 300mm × 300mm

$$\begin{aligned} \sqrt{(A_1/A_2)} &= \sqrt{(1500 \times 1500 / 300 \times 300)} \\ &= 5 > 2 \end{aligned}$$

Therefore for all the Footings, We will take  $\sqrt{(A_1/A_2)} = 2$

Now to compute whether the transfer of load at the base of the column is done properly and the design is safe, we will have to calculate the bearing strength at the end of the column and bearing strength at the base of the footing.

$$\begin{aligned} \text{Permissible Bearing Stress} &= 0.45 \times f_{ck} \times \sqrt{(A_1/A_2)} \\ &= 0.45 \times 25 \times 2 \\ &= 22.5 \text{ N/mm}^2 \end{aligned}$$

$$\text{Actual bearing stress} = \frac{\text{Factored load}}{\text{Area at Column base}}$$

$$\text{Area at the column base} = 300 \times 300 \text{ mm}^2 = 90000 \text{ mm}^2$$

**Table 10: Permissible bearing stress**

Foundation	Factored Load (1.5×P) (kN)	Allowable Bearing stress (N/mm <sup>2</sup> )	Permissible bearing stress (N/mm <sup>2</sup> )	Design Consideration
A1	101	1.12	22.5	Safe
A2	195	2.20	22.5	Safe
A3	101	1.12	22.5	Safe
B1	198	2.30	22.5	Safe
B2	360	4.00	22.5	Safe
B3	198	2.30	22.5	Safe
C1	278	3.11	22.5	Safe
C2	503	5.66	22.5	Safe
C3	278	3.11	22.5	Safe
D1	345	3.88	22.5	Safe
D2	620	6.88	22.5	Safe
D3	345	3.88	22.5	Safe

## 5.9 Check for Development Length( $L_d$ )

Sufficient development length should be available for the reinforcement from the critical section.

Here, the critical section considered for  $L_d$  is that of flexure.

$$L_d = \frac{\phi \times \sigma_s}{4 \times \tau_b}$$

Where  $\tau_b$  = Design bond stress

$\phi$  = Nominal diameter of bars

**26.2.1.1 Design bond stress in limit state method for plain bars in tension shall be as below:**

<i>Grade of concrete</i>	M 20	M 25	M 30	M 35	M 40 and above
<i>Design bond stress, <math>\tau_{bd}</math>, N/mm<sup>2</sup></i>	1.2	1.4	1.5	1.7	1.9

**Fig 26- Design bond stress(IS 456)**

$$L_d = 47 \times \phi$$

**For 8mm Diameter bars,  $L_d = 47 \times 8 = 376\text{mm}$**

Providing 60 mm side cover, the total length available from the critical section is  $0.5(L - a) - 60 + d_{min} = 0.5(1500 - 300) - 60 + 150 = 690 > L_d$ . Hence ok

**For 10mm Diameter bars,  $L_d = 47 \times 10 = 470\text{mm}$**

Providing 60 mm side cover, the total length available from the critical section is  $0.5(L - a) - 60 + d_{min} = 0.5(1500 - 300) - 60 + 150 = 690 > L_d$ . Hence ok

**For 12mm Diameter bars,  $L_d = 47 \times 12 = 564\text{mm}$**

Providing 60 mm side cover, the total length available from the critical section is  $0.5(L - a) - 60 + d_{min} = 0.5(1500 - 300) - 60 + 150 = 690 > L_d$ . Hence ok

**For 16mm Diameter bars,  $L_d = 47 \times 12 = 752\text{mm}$**

Providing 60 mm side cover, the total length available from the critical section is  $0.5(L - a) - 60 + d_{min} = 0.5(2000 - 300) - 60 + 150 = 940 > L_d$ . Hence ok

## **5.10 STAAD.Pro Analysis**

Before the availability of computers and specialized analysis and design programs, towers were often designed by graphical methods. Today's analysis tools allow engineers to refine designs to an unprecedented degree, and as a result, many utilities feel testing is not warranted. However, while great strides have been made in the analysis and design of latticed steel transmission towers, differences between analysis results and full-scale tests still occur.

STAAD.Pro features a state-of-the-art user interface, visualization tools, powerful analysis and design engines with advanced finite element and dynamic analysis capabilities. From model generation, analysis and design to visualization and result verification, STAAD.Pro is the professional's choice for steel, concrete, timber, aluminum and cold-formed steel design of low and high-rise buildings, culverts, petrochemical plants, tunnels, bridges, piles and much more. The following key STAAD.Pro tools help simplify ordinarily tedious tasks:

- The STAAD.Pro Graphical User Interface incorporates Research Engineers' innovative tabbed page layout. By selecting tabs, starting from the top of the screen and heading down, you input all the necessary data for creating, analyzing and designing a model. Utilizing tabs minimizes the learning curve and helps insure you never miss a step.
- The STAAD.Pro Structure Wizard contains a library of trusses and frames. Use the Structure Wizard to quickly generate models by specifying height, width, breadth and number of bays in each direction. Create any customizable parametric structures for repeated use. Ideal for skyscrapers, bridges and roof structures.
- The STAAD.Pro Foundation is useful for analysis and design of the structures and it is possible to import the structure directly from STAAD structure wizard, thus simplifying the design process

## Features of STAAD.Pro

- “Concurrent Engineering” based user environment for model development, analysis, design, visualization and verification
- Full range of analysis including static, P-delta, pushover, response spectrum, time history, cable (linear and non-linear), buckling and steel, concrete and timber design included with no extra charge
- Object-oriented intuitive 2D/3D graphical model generation
- Pull down menus, floating tool bars, tool tip help
- Quick data input through property sheets and spreadsheets

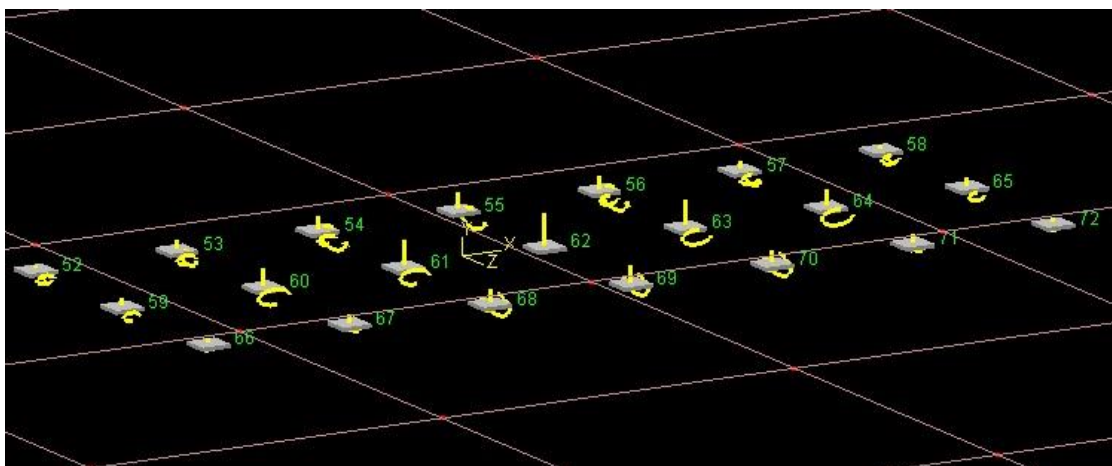

Fig 28- Layout of footings on STAAD.Foundation

## 5.11 Reinforcement detailing

Actual depth of Foundations = effective depth + nominal cover +  $1.5 \times$  bar diameter

Nominal cover provided should be greater than 50 mm according to IS 456.

But if footing is to laid directly on the ground ,then cover provided should be atleast 75 mm. Therefore we are providing cover = 75mm

**Table 12 – Actual depth calculation**

<b>Foundation</b>	<b>Effective depth(mm)</b>	<b>Nominal cover(mm)</b>	<b>Bar Diameter (mm)</b>	<b>Actual depth (mm)</b>

**Fig 31- General Detailing of Footings**

## 5.12 Design charts

The allowable bearing pressure method is sufficient for small to medium sized structures. However, larger structures especially with greater column loads, warrant a more easy and precise method for calculating the dimensions of footings.

Design charts are mainly graphs between the axial loads  $P$  and width of the footing  $B$

Procedure to develop Design charts is:

- Determine the footing shape. Each shape has its own Design chart
- Select the depth of foundation
- Set some value of the footing width  $B$ , then conduct a bearing capacity analysis and compute the column load. Then select a new series of values of  $B$  and compute the corresponding  $P$  and plot the points  $(B, P)$  on a graph. Continue the process until a perfect graph is obtained
- Developing the settlement curve
- Select a settlement value for a curve (eg. 20mm)
- Select a footing width  $B$  arbitrarily and corresponding load  $P$
- By trial error, adjust the value of  $P$  until the computed settlement matches the assumed settlement. Plot this  $(B, P_a)$
- Repeat for different settlement values

Design charts are like ready to implement design methods which are designed by a geotechnical engineer and handed over to a structural engineer, who can easily calculate the width of footing with the help of design loads, thus making the work of an engineer easier.

## SECTION 6 : RESULTS AND CONCLUSIONS

At depth = 1.5m soil profile is low compressible silty clay. Bearing Capacity of the soil according to 3 performed tests that is Plate Load test, Standars penetration test and Direct cone penetration test are

### Bearing capacity from different tests at D=1.5m

Test	Depth	Nabp
PLT	1.5m	14 t/m <sup>2</sup>
DCPT	1.5m	21 t/m <sup>2</sup>
SPT	1.5m	26 t/m <sup>2</sup>

From the graph obtained in PLT test, it can be said our soil may be somewhere between partially cohesive soil and cohesive soil but most part of the graph is represented closely by behavior of cohesive soil.

Minimum net allowable bearing pressure is from PLT.

From the calculated N value which is 18, value of unconfined compressive strength (20 t/m<sup>2</sup>) and unconfined shear strength (10 t/m<sup>2</sup>) is known. Also it can be said that our soil is stiff clay.

PLT can be considered as the most effective and easy to perform test. Effective in the sense that it gives the direct relationship between allowable pressure and settlement at the depth of the footing also this test does not give the ultimate settlement particularly in case of cohesive soil as it is a short duration test.

There is a great variation in bearing capacity due to variation in ground water level and every method deals with this effect differently.

All the calculation related to soil analysis has been done, like bearing capacity and allowed settlement from various tests is known also the soil layer at which footing has to be designed is clay of low compressibility.

Design of isolated Footing for shopping complex at Pratap vihar, Ghaziabad, U.P.  
 Taking Safe Bearing Capacity = 140 kN/mm<sup>2</sup>.

**Table 13- Final results (a)**

<b>Foundation</b>	<b>Axial Load (kN)</b>	<b>Dimensions (m × m)</b>	<b>Settlement (mm)</b>	<b>Effective footing depth (mm)</b>
A1	67	1.5m × 1.5m	13.67	150
A2	130	1.5m × 1.5m	25.1	150
A3	67	1.5m × 1.5m	13.67	150
B1	132	1.5m × 1.5m	25.2	150

- This Work attempts to study, analyse and calculate the Bearing capacity of the soil of a real life location, Pratap vihar in Ghaziabad, Uttar Pradesh
- Test data of three tests namely- PLT, SPT, DCPT conducted by technicians from IIT-Roorkee is provided and safe bearing capacity of the soil at different depths is calculated on basis of the test data
- Safe bearing capacity(SBC) for depth = 1.5 m is coming out to be 140 kN/m<sup>2</sup>
- Based on the calculation of SBC, Isolated(shallow) Foundation is designed for a proposed shopping complex on the same soil profile at depth = 1.5m
- Axial Loads on each foundation is calculated by considering every Load combination(Table
- Dimensions of footings are also calculated for Safe bearing Capacity.
- Settlement for each footing is calculated by Indian Standards and settlements are within permissible limits

- Footing depth is calculated by considering all the criteria stated in Indian Codes
- R.C.C Design for all the foundations is done and steel required is calculated. All the checks for tensile reinforcement is performed as stated in Indian design code IS 456:2000.

## **SECTION 7 : FUTURE SCOPE**

After completely analyzing the soil through all the field test performed and data collected from them, I have successfully designed Isolated footing for a shopping complex . Now, as we have completely analyzed the soil,so now safe bearing capacity at different depths can be calculated using the same process and the calculated bearing capacities can be used to design foundations at different depths.For bigger structures having more than 3 floors, different foundations can be designed.If the loads on foundation is coming out to be very high and the safe bearing capacity of soil at desired depth is less, then Mat foundation can be designed for such structures and if the safe bearing capacity is more then Combined foundations or even deep foundation design can also be taken into the account.
