DECLARATION

I hereby declare that this project report titled '**PERSONAL CLOUD BACKUP IN MOBILE SUBSCRIPTION SERVICES**' submitted at **Jaypee University of Information Technology, Waknaghat, India** is an authentic record of my work carried out under supervision of **Mr. Abhishek Agarwal**. I am fully responsible for the contents of my Bachelors of Technology internship project at GEMALTO.

SUPERVISOR’S CERTIFICATE

This is to certify that the work reported in Bachelors of Technology Industrial Training entitled “**PERSONAL CLOUD BACKUP IN MOBILE SUBSCRIPTION SERVICES**” submitted by **Shubham Upadhyay** at **Jaypee University of Information Technology, Waknaghat, India** is a bonafide record of his original work carried under my supervision.

Mr. Abhishek Agarwal

(Reporting Manager)

ACKNOWLEDGEMENT

The internship opportunity at 'Gemalto' was a great learning experience. I would like to express my gratitude to my college for allowing me to do internship in the last semester of my Bachelors of Technology degree. I would like to express my deepest gratitude to my functional manager **Mrs. Awanti Singh** and reporting manager **Mr. Abhishek Agarwal** who stood beside me on every step and inspite of their busy schedule made themselves available whenever I needed them.

It is my radiant sentiment to place on record my best regards, deepest sense of gratitude to my mentors, **Mr. Mohit Garg** and **Mr. Sandeep Kumar** and the entire team of **MSS** for making it easy for me to survive and making learning so enjoyable and not to forget their careful and precious guidance which was extremely valuable for my study both theoretically and practically.

I would like to acknowledge guidance of my college mentor, Dr. Yashwant Singh who constantly guided me during my internship and suggested me to improve on every aspect.

ABOUT THE COMPANY (Gemalto)

Gemalto is a world leader in digital security. It is also the largest manufacturer of sim cards in the world. It generated a revenue of 3.1 billion euros in 2016. Employee strength is 15,000 of 119 nationalities. Its expertises in authentication and data protection. The areas are digital banking, e – Government, manufacturing of sim cards, software licensing, software monetization, vehicle telematics, mobile connectivity and data encryption.

Clients of this company come from 180 countries. They comprise of well-known enterprises, mobile operators, banks and financial institutions, national administration, software publishers and a large number of other industries looking for simplicity, security and efficiency.

Companies such as Verizon, Amazon Web Services, Barclays, Alibaba, Banco Santander and governments of Peru, U.K., Algeria and about 27 other countries have trust in Gemalto. It provides technology like e-Passports, e-Driving licence, e-ID citizen cards, e-Healthcare cards, e-Government ID and transportation. The fundamental in our relationship with the clients is trust. Ultimately, everything that is done is founded on the trust earned from the clients over the years.

ABSTRACT

I was initially asked to deliver a presentation on Blockchain technology and Bitcoins. Following the presentation I got training of the technologies used in the PCB i.e. Personal Cloud Backup project. I was trained in Spring MVC framework, use of Eclipse Integration Development Environment, Junit, Mockito, SOAP UI, Mercurial, Jenkins, JIRA.

I was assigned many tasks which enhanced my knowledge and experience. I then had a chance to work on the live project and fixed a cosmetic bug on web interface of the customer care console.

I was also given an exercise to calculate the 'Mobile Network Bankwidth'. Initially, I did this exercise and calculated the data manually which took about 20-25 minutes for 10 transactions approximately and later automated the process using Pattern and Regex matching libraries in Java and it reduced the data calculation time to a few seconds.

I created a Java project and implemented the concept of 'Pagination' with my own business logic. After doing this I had a better understanding of the backend working of JSP, Servlet pages, database connectivity, hosting a server and I also learnt how to troubleshoot the connectivity problems between these using console and logging techniques.

Another project was of 'URL rewriting'. It helped me understand the use of url rewriting and I hosted an Apache Web Server on local machine and wrote rewriting rules to do tasks like, preventing the image hotlinking, display custom web pages on HTTP status, forbid a page from being displayed.

LIST OF ACRONYMS AND ABBREVIATIONS

1. PCB	Personal Cloud Backup
2. OTACS	Over the Air Configuration Server
3. OTA	Over the Air
4. FC	Flow Control
5. DD	Device Detection
6. SMSC	Short Message Service Center
7. SMSE	Short Message Service Engine
8. AHC	Auto Handset Configuration
9. JSP	Java Server Pages
10. JS	Java Script
11. PBGUI	Phonebook Graphic User Interface
12. PBE	Phonebook Engine
13. DDE	Device Detection Engine
14. HTTP	Hyper Text Transfer Protocol

INTRODUCTION TO PROJECT

PCB – Personal Cloud Backup

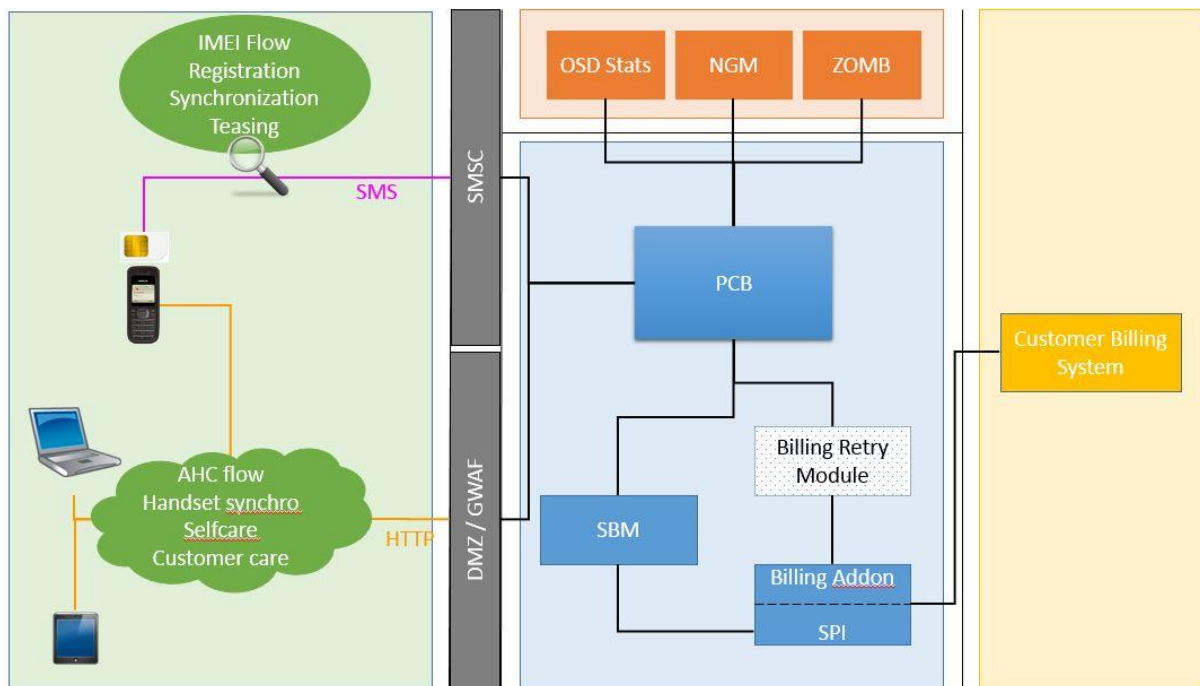

Fig 1

PIM

- Personal Information Manager.
- Its goal is to store, manage, and synchronize personal data. It is deployed on Weblogics server.
- Its prime aim is to backup or restore the contacts(with and without avatar), calendar events and notes of the handset

SIM - GATEWAY

- It is an application software which permits to communicate with the SIM Card. It is deployed on JBOSS server.
- It is designed to manage the synchronization of data on the SIM card.

The different ways to access the PCB:

- The first way is through the SMS for mobiles that are not compatible with any kind of internet services.
 - Using an MO a request is sent to the SMSC where it is redirected to the OTACS through the GWAF where is checked for any malformed MO.
 - Then it is passed on to the OTA where it is authenticated and redirected to the PCB module.
 - Here, in the PCB module it is checked if the data is of the handset or the SIM card and is directed respectively.
- The second way is through the mobile app
 - In this the MO or the http request is sent through the app. There is app for both android and iOS.
 - This request is sent to the OTACS through the same GWAF where is checked for any malformed MO.
 - It is then passed on to OTA for authentication and then redirected to the PCB module.
 - Here, it is further directed to the PIM or SIM-gateway where the request would be processed.
- The third way is through the http request on the web browser
 - Its flow is same as the above for mobile app.
 - The difference is that the http request is generated through the web browser rather than the app hitting any web service.

METHODOLOGY USED

AGILE METHODOLOGY (SCRUM)

It is not a development process. It is an alternative method to the conventional project management. In it the requirement and solution evolve through the team labour of self-organizing cross-functional teams. It includes learning adaptively, delivery well before time, continuous delivery, evolutionary development and encourages rapid and flexibility to change i.e. when the requirements of a project change the team changes with it.

Scrum Methodology:

It is a part of Agile movement. As the Agile Movement doesn't provide concrete steps so in it the inspection and feedback taking process is carried on hand in hand so as to deal with the complexity and risk. Time is divided into short durations usually of 2-3 weeks known as sprints. At the end of sprint stakeholders, team members meet to see a demonstrated potentially shippable product increment. The work done is then evaluated and is kept in shippable state at all times.

SELF CARE PORTAL

The screenshot displays the 'Cloud Backup' web portal interface. At the top, there is a blue header bar with the 'Cloud Backup' logo on the left, the text 'Cloud Backup' in the center, and a language dropdown menu set to 'English' on the right. Below the header, the main content area is divided into two sections. The first section, titled 'Login', features a red error message: 'At least one field is not filled in correctly.' Below this, there are two input fields: 'Login' (containing 'Your phone number' and '0177xxxxxxx') and 'Password' (containing 'Type your password here' and 'between 4 and 32 characters'). A 'Login' button and a 'Get my password' link are positioned at the bottom right of this section. The second section, titled 'New at Cloud Backup? Sign up now!', contains three input fields: 'Login' (containing 'Your phone number' and '0177xxxxxxx'), 'Password' (containing 'Type your password here' and 'between 4 and 32 characters'), and 'Confirm password' (containing 'Type your password again'). A 'Sign up now!' button is located at the bottom right of this section. At the very bottom of the page, there are two links: 'What is Cloud Backup?' and 'Can I use it on my phone?'.

Fig. 2

Here this is the login page of selfcare login web portal. It is here that a user can login to his account or signup to create a new one.

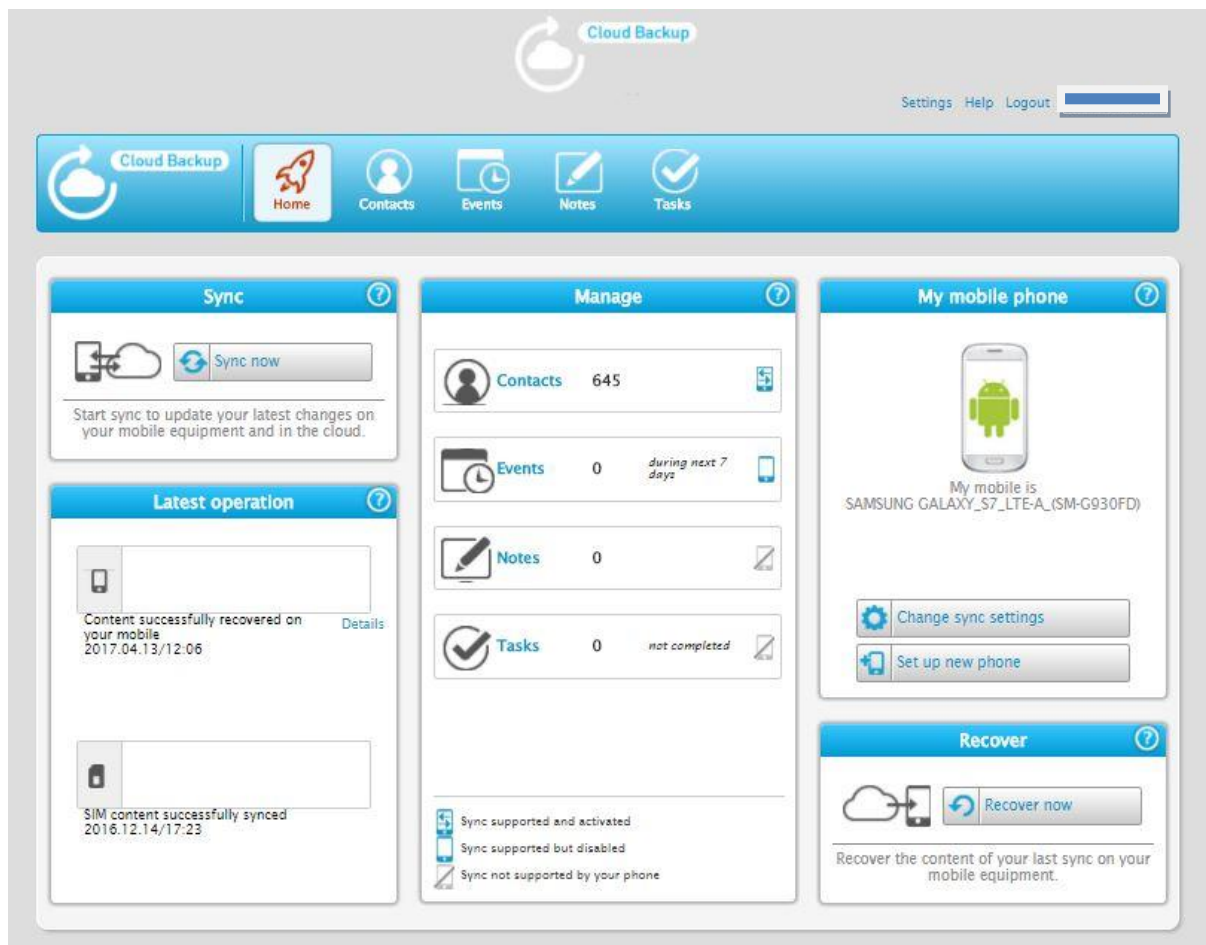

Fig 3

This is the page that is displayed after logging in the selfcare portal. Here you can manage these:

- Contacts
- Calender
- Notes
- Task
- Setup new phone
- Synchronize your handset to the cloud

CUSTOMER CARE PORTAL

The screenshot displays the Gemalto Customer Care Console. At the top left is the Gemalto logo with the tagline "security to be free". To its right is the text "customercareconsole". Below the logo, there is a navigation bar with "Logout" and "Change my Pwd". A sidebar on the left contains two menu items: "Search Subscriber" and "Provision Subscriber", both preceded by orange star icons. The main content area is titled "Search Subscriber" and features two search sections. The first section, "Search by MSISDN", includes a text input field, a "Search" button, and the instruction "Please enter the subscriber MSISDN". The second section, "Search by Login", also includes a text input field, a "Search" button, and the instruction "Please enter the subscriber login name". Both search sections have a "collapse" link in the top right corner.

Fig 4

Here is the customer care web console. It is through this console that the MNO customer care looks in when any complaint or problem occurs to any of its customers. One can look for the details of the customer using the MSISDN i.e. our 10 digit phone number or through his/her login name.

Fig 5

TOOLS USED

JIRA

It is the most famous software among Agile development teams. It helps view the status of all the projects that are going on. It helps maintain flexible scrums. It helps to bring the team together. It helps create sprints, tasks and sprints. This assists in planning track and release report.

It also helps in sorting, filtering and colour coding. All the changes on production issue can be viewed by the entire team. Code changes builds and deploys can be seen by all.

Targets all the issues for release and hence confirms that all the issues are covered. It can also helps us view the data in form of burndown chart, sprint chart, velocity chart, cumulative chart, version chart, epic chart, control burndown, release burndown etc.

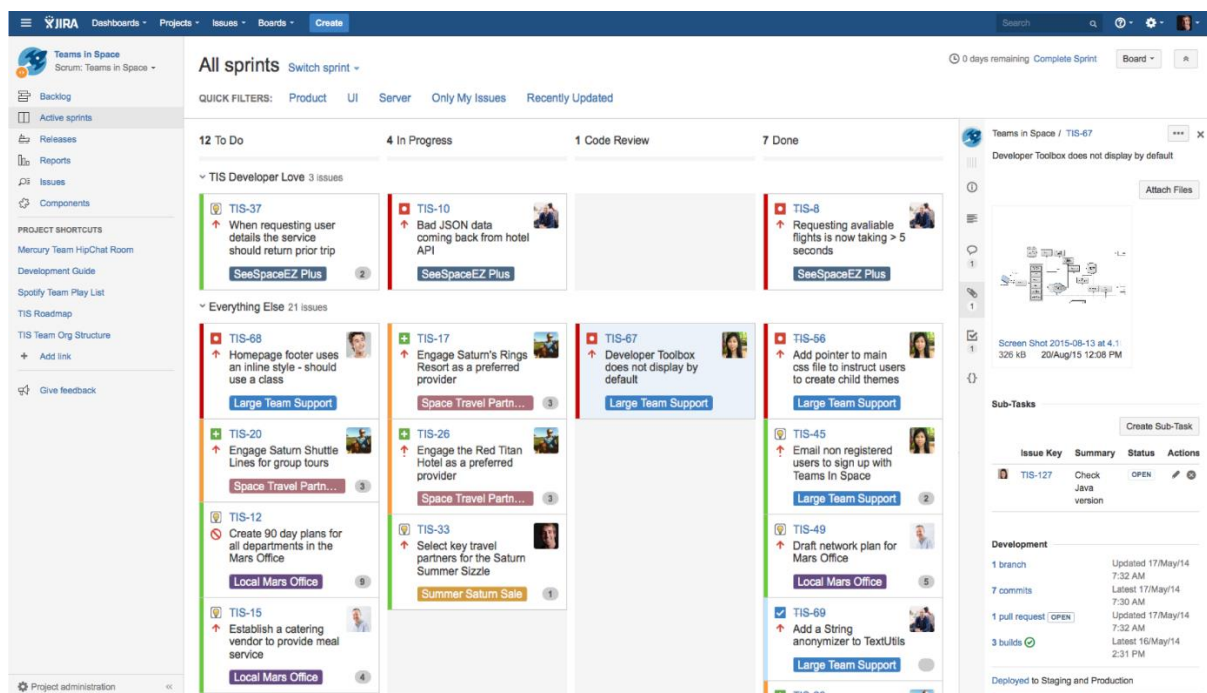

Fig 6

JENKINS

Jenkins is used to automate the tasks like building, deployment and testing. It requires a Java Runtime Environment installed. It can work as a stand alone application on any machine with at least Java 7 installed in it. It can be called as self-contained, open source automation server. It works in 3 steps:

1. The software developers check their source code.
2. Jenkins picks up the changes in the code and trigger a build and run any regression or system tests if required.
3. The build output is available in the Dashboard. Also an automatic notification can be sent to the developer.

The screenshot shows the Jenkins web interface in a browser window. The address bar displays 'ladle.lbl.gov:8080'. The Jenkins logo is at the top left, and a search bar is at the top right. On the left sidebar, there are links for 'New Job', 'People', 'Build History', 'Project Relationship', 'Check File Fingerprint', 'Manage Jenkins', and 'My Views'. Below these links, there is a 'Build Queue' section stating 'No builds in the queue.' and a 'Build Executor Status' table with two rows, both showing 'Idle' status.

The main content area displays a table of builds. The table has columns for 'S' (Success/Failure icon), 'W' (Weather icon), 'Name', 'Last Success', 'Last Failure', and 'Last Duration'. The builds listed are:

S	W	Name	Last Success	Last Failure	Last Duration
		build-chebi	5 days 22 hr (#6)	9 days 14 hr (#5)	4 min 49 sec
		build-cl	3 days 1 hr (#12)	19 days (#10)	1 min 55 sec
		build-fbdt	5 days 22 hr (#7)	15 days (#6)	2 min 2 sec
		build-fypo	3 days 9 hr (#7)	7 days 5 hr (#5)	2 min 22 sec
		build-qaz	1 day 0 hr (#3)	1 day 0 hr (#2)	26 min
		build-go	4 hr 55 min (#178)	N/A	6 min 48 sec
		build-go-taxon	1 mo 3 days (#106)	44 min (#243)	3 min 40 sec
		build-go-xp-chebi	4 hr 48 min (#115)	N/A	2 min 21 sec
		build-mp	N/A	14 hr (#68)	4 min 1 sec

Fig 7

MERCURIAL

TortoiseHg is the front end of Mercurial that runs on Windows platform. Its written in PyQt and underlying client can be used on the command line.

Mercurial is a Version Control System that helps the management of the code just like the most popular one as GIT HUB. Infact both of these use the GIT commands in the background but just the frontend part is different in both the cases.

It has some terminology like:

- **Pull the code:** It means to make a copy of the latest existing version of code in your local system so as to make some changes or build it.
- **Commit the changes:** After making the required changes you must commit your changes to the common repository which will be shown as a separate branch merging into the main one from which you have pulled the code.
- **Merge code:** The code is then verified and merged to the main-branch and the latest version to make your commit permanent.

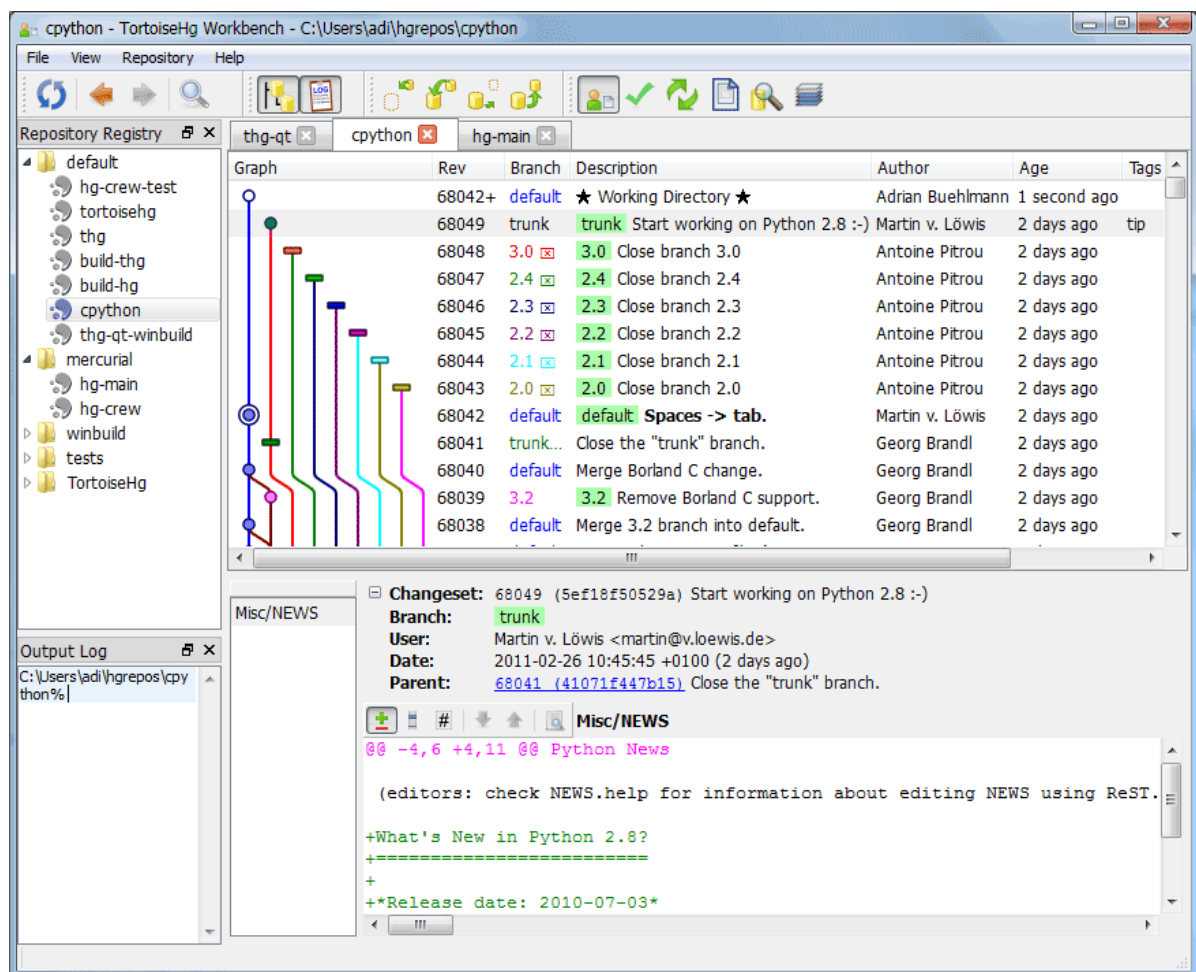

Fig 8

TASKS DONE

1. MOBILE NETWORK BANDWIDTH CALCULATION

The steps I followed to do this exercise were:

- The first step was to generate an (.apk) file by giving the parameters to the build server. After this an acknowledgement mail would be sent to you telling you if your configuration is correct or not. Then after 15 minutes an email would be sent to you with the attachment of the (.apk) file.
- The second step would be to install the app on the handset, which in my case was Samsung Galaxy S8. At this step it required to create a folder with particular file inside the handset. It was done so as to record the logs of the activity going on in the app.
- After adding the contacts from the selfcare portal of the app (i.e. the web page from where we can handle our account. The selfcare portal's server end is accessed through Putty and then the contacts are added in one go.
- The app is then started on the app and operations are performed using the specific use-cases i.e. 100, 105, 200, 205 contacts backup and restore.
- The data then logged is viewed in the log file created in the handset.
- The data sent and received is then calculated using a manual calculator which is a time consuming process because in one restore or backup operation there are many small modules in which the data is sent or received.
- To summarize the above So the exercise would be to calculate, in a realistic use-case (addressBook with 100 contacts (First Name/Last Name + 2 phone numbers), included 10% of contacts with avatar)
 - The size of a Slow synchronization (contact on server – restore on Mobile) = Nb of kB sent from PCB Server to Mobile App
 - The size of a subsequent sync with 5 contacts without avatar updated.

AUTOMATION :

In order to save the time consumed in the last process I wrote a Java program which would do the following:

- It would fetch the data from the log file
- Using the Regular Expression I parsed the data for the particular values that are needed to calculate the data.
- Then using the Pattern and Matcher libraries in Java I parsed the data calculated to further match the data more specifically and segregate the data in each block.
- It calculated the logged data within seconds which would take about 20-25 minutes earlier when done manually.
- So it reduced the human effort to a great extent and it is currently being used to work further on the live project to add the new feature.
- The Java program that I wrote was error free and handled the following cases :
 - If the log file is not found at the specified location.
 - If the data is corrupted.
 - If the blocks are not separated correctly i.e. any anomaly in the writing of log file.
 - If the log file is empty.
 - If the data sent/received is not in numeric format.

Fig. 12

BUG:

This was a cosmetic bug as “Session Id: “. It should have been with a space after Id i.e. “Session Id :” .

BUG FIX:

This bug was fixed by changing the properties file in which the string was hardcoded. It had to be changed there. The bug removal was stable and did not unstabilize the system.

3. PAGINATION

Displaying many records in a single page may take time, so it is better to break the page into parts. To do so, we create pagination application.

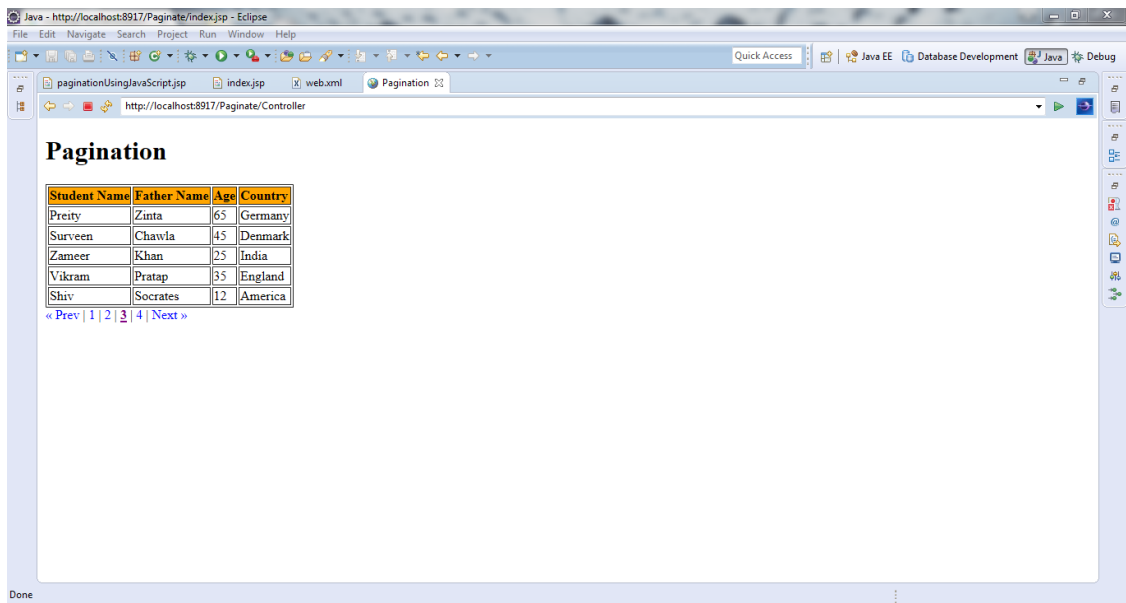

Fig. 13

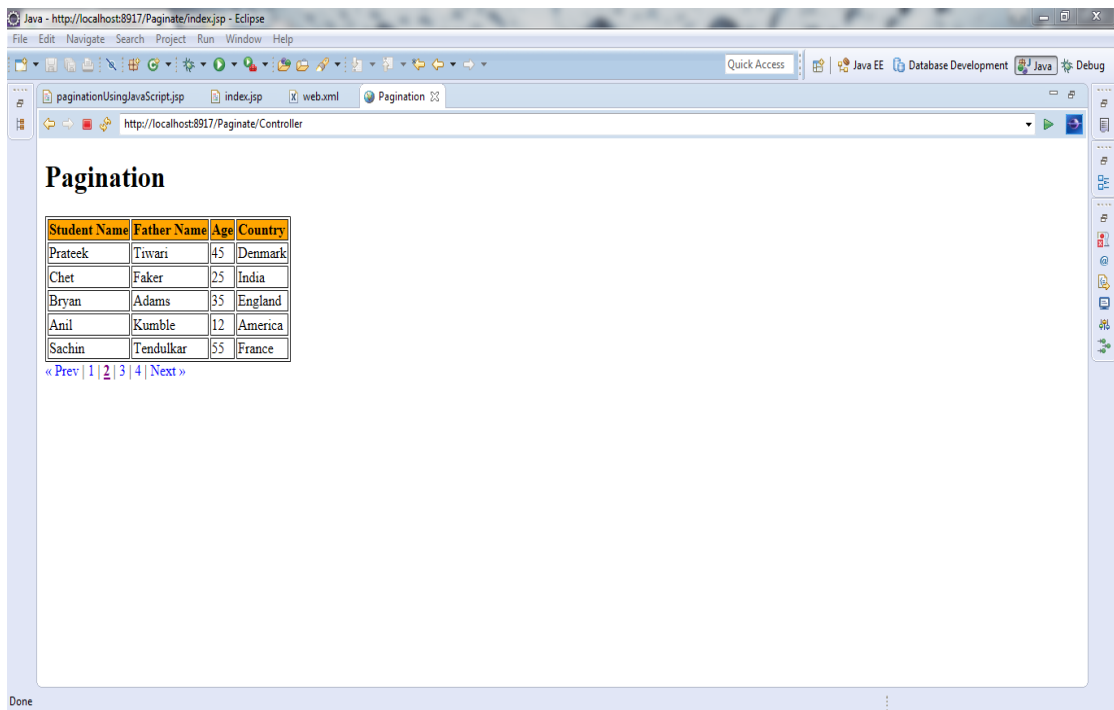

Fig. 14

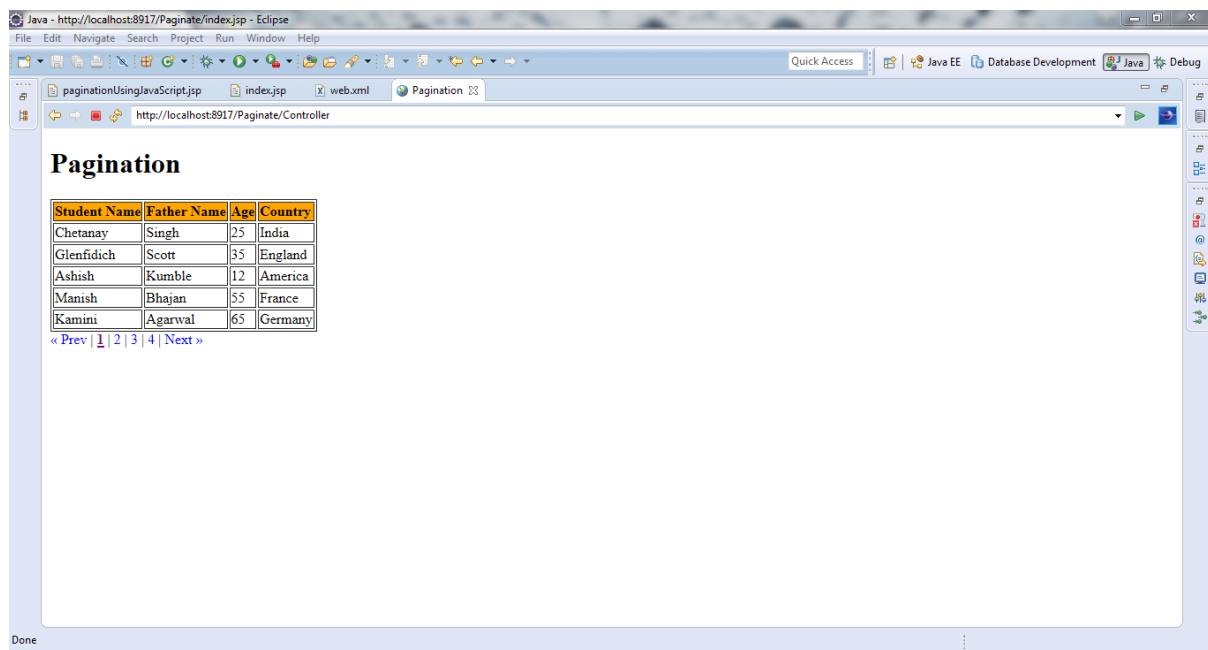

Fig. 15

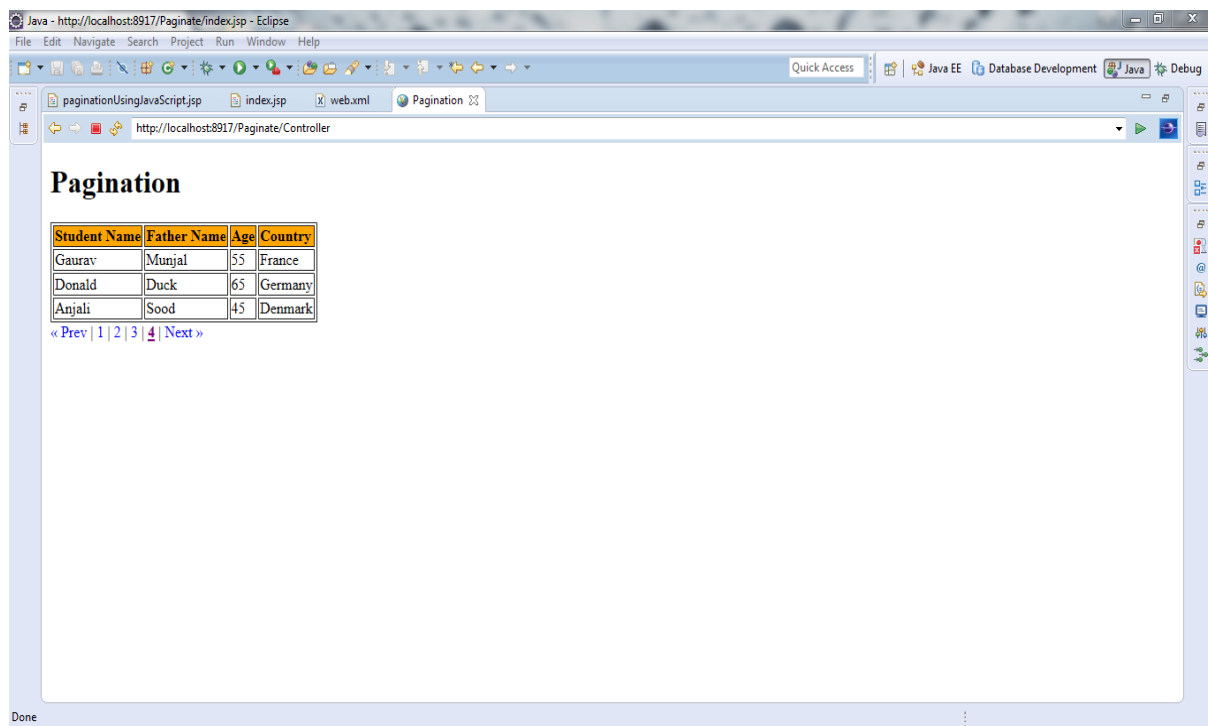

Fig. 16

4. URL REWRITING ON APACHE WEB SERVER

URL rewriting is the process of rewriting or hiding the real page names so as to protect the website from getting hacked or intruded by hackers.

The OWASP ModSecurity Core Rule Set (CRS) is a set of generic attack detection rules for use with ModSecurity or compatible web application firewalls. The CRS aims to protect web applications from a wide range of attacks

It uses some flags such as:

- Last (L)
- Nocase (NC)
- Redirect (R)
- Forbidden (F)
- Ornext (OR)
- Next (N)

NOTE: You must write all your rewriting rules in **httpd.conf** file in your Apache Web Server.

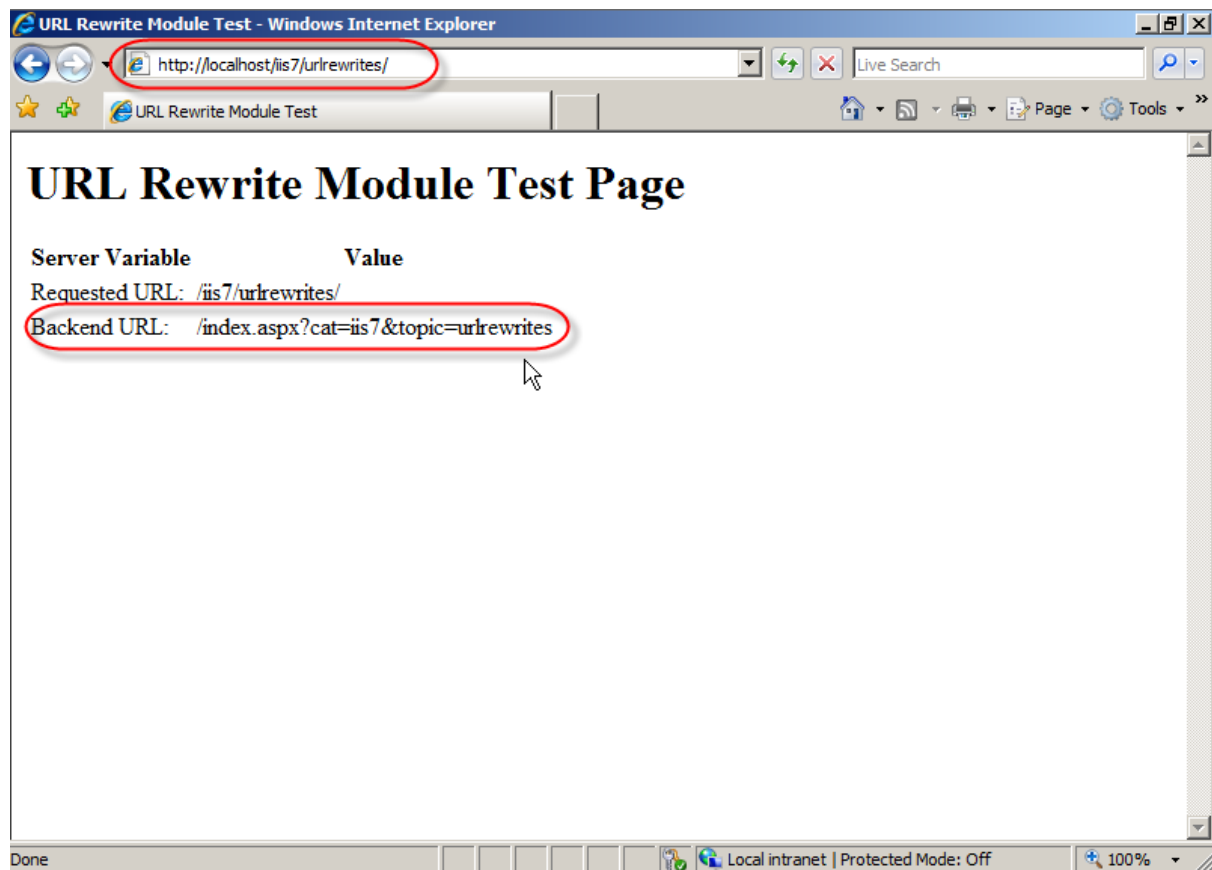

Fig. 17

- **Eliminating www from a domain**

Rewrite Engine on

```
RewriteCond %{HTTP_HOST}!^juit.com$ [NC]
```

```
RewriteRule .? http://juit.com%{REQUEST_URI} [R=301,L]
```

Rewrite Engine off

- **Prevent image hotlinking**

Rewrite Engine on

```
RewriteCond %{HTTP_REFERER} !^$
```

```
RewriteCond %{HTTP_REFERER} !^http://(www.)?juit.com/ [NC]
```

```
RewriteRule .(gif|jpg|png)$ - [F]
```

Rewrite Engine off

- Prevent image hot-linking and redirecting to a specific image
- Displaying a custom web page for HTTP error codes

5. TRASH BIN BUG

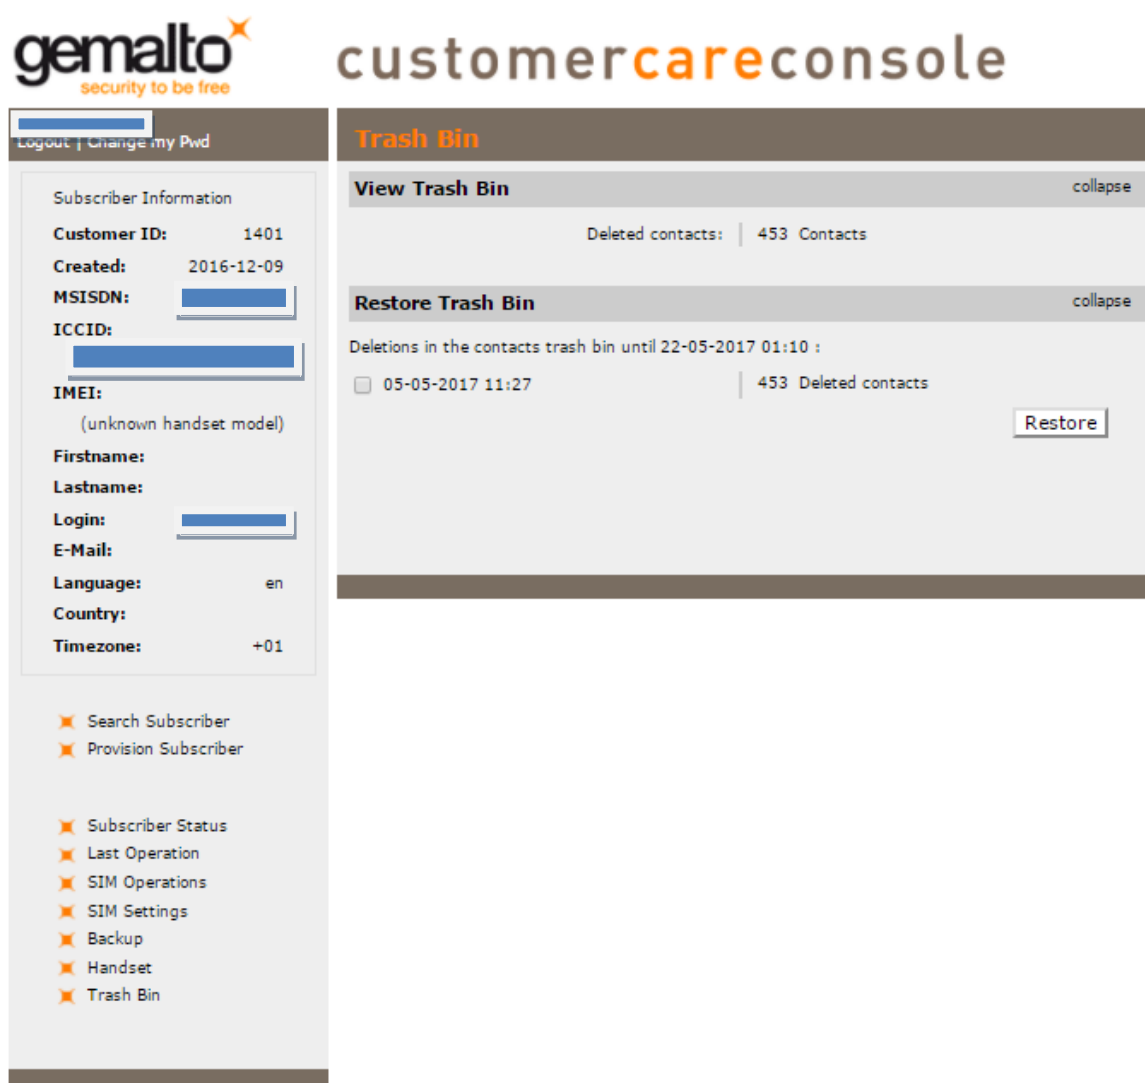

Fig. 18

BUG: When we selected 1 or more than 1 restore contact and click on Restore button then the entire list is being restored but only the selected ones should get restored.

BUG FIX: The list that is being formed at the time of selection of items to be restored is different from the one that is being used to finally execute the Restore functionality. So, the

6. BLOCKCHAIN AND BITCOIN PRESENTATION

CREATION OF BITCOINS

- It can be done using 'mining'. Mining is the process of spending computing power to process transactions, secure the network, and keep everyone in the system synchronized together.
- Second method is by exchanging fiat currency for bitcoins.

Bitcoin transaction cycle

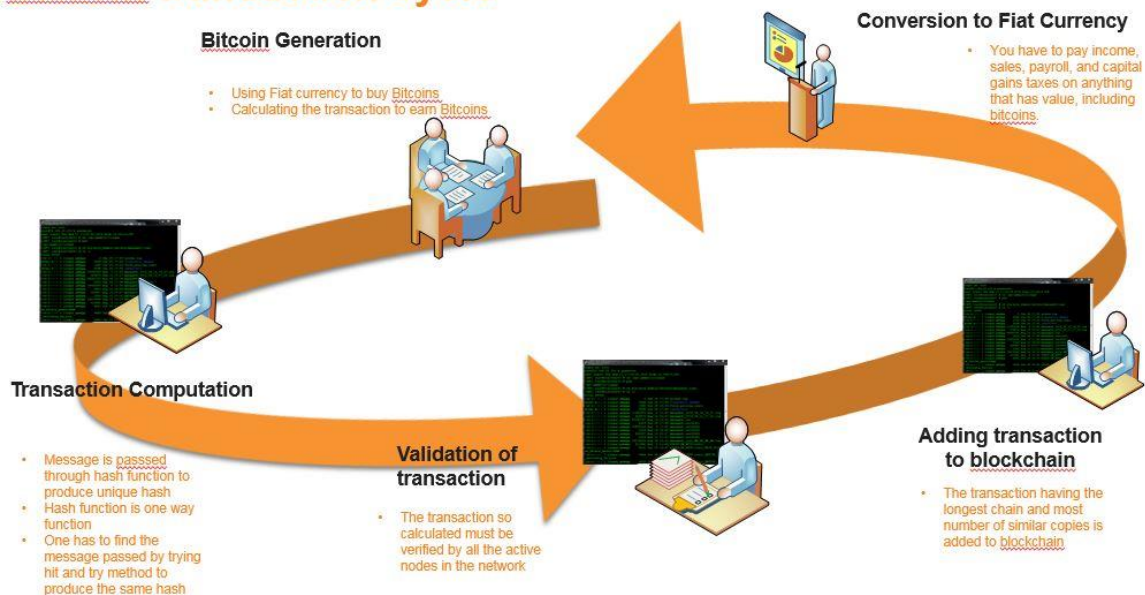

Fig. 19

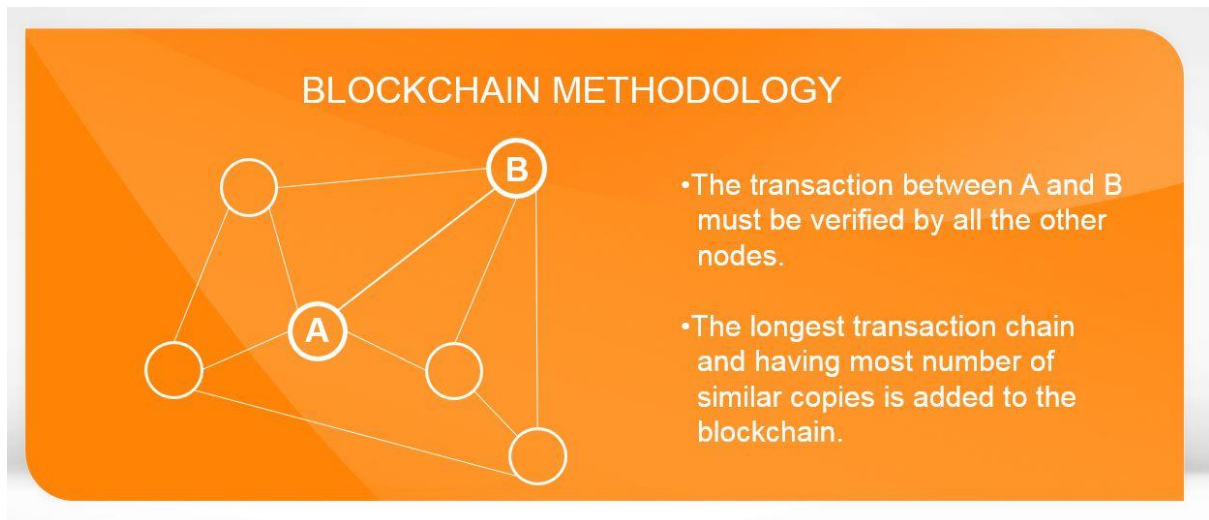

Fig. 20

- The transaction between A and B must be verified by all the other nodes.
- The longest transaction chain and having most number of similar copies is added to the blockchain.

CONCLUSION

The learning experience in the industry exposes you to much more technologies and methodologies of development when compared to the theoretical knowledge. There were many technologies like Spring MVC framework which gave me a good understanding of object injection, annotation etc. It helped me understand how the code was written so that it can be reused later on and also modified easily. Another interesting aspect was using the Mockito framework and Junit framework to write the test cases and test our written code very efficiently. I also got a chance to understand the stack of hardware and software used so as to work together to achieve a common goal. The use of virtual machine to deploy the web servers like Weblogics and JBOSS, databases like Oracle 11g and logging tool like log4j.

The product i.e. PCB on which I am working on is being used in many countries like latin America and Europe. It has a very less latency and is highly efficient. According to a study done by Gemalto about 80 percent of people are willing to pay extra to avail these services of backup and restore their data. These days data is money hence everyone wants to safeguard their data so the demand of this product is high.

I would conclude the report by saying that project work assigned to me has been completed to my satisfaction and I have gained significant knowledge.
